2003 Adv Higher Chemistry Marking Scheme

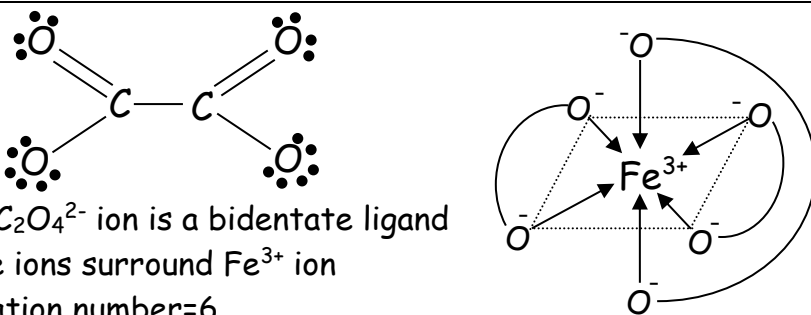

MC Qu	Correct Answer	% Correct	Reasoning
1	A	77	<input checked="" type="checkbox"/> A β -particles are electrons emitted from a nucleus when a neutron splits into a proton and an electron <input checked="" type="checkbox"/> B γ -radiation, X-rays, UV, visible, Infra red, Microwaves, radio & TV are electromagnetic radiation <input checked="" type="checkbox"/> C γ -radiation, X-rays, Ultraviolet, visible, IR, Microwaves, radio & TV are electromagnetic radiation <input checked="" type="checkbox"/> D γ -radiation, X-rays, UV, visible, Infra red, Microwaves, radio & TV are electromagnetic radiation
2	C	80	Potassium permanganate KMnO_4 is purple as magenta/purple light is transmitted. Magenta is a mixture of red & blue light \therefore green light must be absorbed
3	B	69	<input checked="" type="checkbox"/> A Melting points decrease down group 1 (data book p6) <input checked="" type="checkbox"/> B Electronegativity increases down group 1 \therefore bigger the Δ electroneg the greater the ionic nature <input checked="" type="checkbox"/> C The 1 st ionisation energy decreases down group 1 as atoms become bigger (data book p10) <input checked="" type="checkbox"/> D NaCl has 6:6 co-ordination but CsCl has 8:8 coordination in their lattice structures
4	A	55	<input checked="" type="checkbox"/> A $\text{VOF}_3 \rightarrow (\text{VO}^{3+})(\text{F}^-)_3 \rightarrow \text{VO}^{3+}$ ion \rightarrow as $\text{O} = -2 \therefore \text{V} = +5$ <input checked="" type="checkbox"/> B $\text{V}(\text{OH})_2 \rightarrow \text{V}^{2+}(\text{OH}^-)_2 \rightarrow \text{V}^{2+}$ ion $\therefore \text{V} = +2$ <input checked="" type="checkbox"/> C $\text{VCl}_4 \rightarrow \text{V}^{4+}(\text{Cl}^-)_4 \rightarrow \text{V}^{4+}$ ion $\therefore \text{V} = +4$ <input checked="" type="checkbox"/> D $\text{VSO}_4 \cdot 7\text{H}_2\text{O} \rightarrow \text{V}^{2+}\text{SO}_4^{2-} \rightarrow \text{V}^{2+}$ ion $\therefore \text{V} = +2$ (NB ignore $\cdot 7\text{H}_2\text{O}$)
5	A	63	Maximum absorbance when volume of ligand solution L is twice the volume of the M^+ solution (both 0.1 mol l^{-1}) \therefore Complex is ML_2 (not M_2L). Ligand is neutral so charge on complex is the same as the charge on the metal ion $\text{M}^+ \therefore [\text{ML}_2]^+$
6	D	80	<input checked="" type="checkbox"/> A Pauli Exclusion Principle: No electron has the same 4 quantum numbers <input checked="" type="checkbox"/> B Heisenberg Uncertainty: momentum and position of an electron cannot be defined at same instant <input checked="" type="checkbox"/> C Aufbau principle: Orbitals fill up in order of lowest energy (1s,2s,2p,3s,3p,4s,3d,4p,5s,4d,5p,6s,4f, etc) <input checked="" type="checkbox"/> D Hund's Rule: orbitals fill up single rooms first to maximise the number of parallel spins
7	D	60	Co atom electron arrangement: $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^7$ or $[\text{Ar}] 4s^2 3d^7$ Co ²⁺ ion electron arrangement: $1s^2 2s^2 2p^6 3s^2 3p^6 3d^7$ or $[\text{Ar}] 3d^7$ (NB 4s electrons removed first)
8	D	29	$2\text{Zn} + \text{O}_2 \rightarrow 2\text{ZnO}$: production of Zn is the reverse reaction. Upper line is reversed on Ellingham diagrams. $2\text{Zn} + \text{O}_2 \rightarrow 2\text{ZnO}$ becomes the upper line at temperatures above 1400°C At 1400°C , decomposition of ZnO becomes feasible and ZnO starts to decompose to form Zn
9	B	46	no. of moles of NO_3^- ion = volume x concentration = $0.5\text{l} \times 0.1 \text{ mol l}^{-1} = 0.05 \text{ mol NO}_3^-$ ions But 1 $\text{Ca}(\text{NO}_3)_2$ formula unit releases 2 NO_3^- ions \therefore no of moles $\text{Ca}(\text{NO}_3)_2$ needed = 0.025 mol $\text{volume} = \frac{\text{no. of mol}}{\text{concentration}} = \frac{0.025 \text{ mol}}{0.25 \text{ mol l}^{-1}} = 0.1 \text{ litres} = 100 \text{ cm}^3$
10	D	67	Ammonium dichromate = $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$ Decomposition reaction: $(\text{NH}_4)_2\text{Cr}_2\text{O}_7 \longrightarrow \text{Cr}_2\text{O}_3 + \text{N}_2 + 4\text{H}_2\text{O}$
11	C	51	<input checked="" type="checkbox"/> A BaCl_2 is ionic \therefore no atoms present <input checked="" type="checkbox"/> B BaCl_2 is ionic \therefore no molecules present <input checked="" type="checkbox"/> C BaCl_2 is $\text{Ba}^{2+}(\text{Cl}^-)_2 \therefore$ 1 mol BaCl_2 formula units contains 1 mol of positive Ba^{2+} ions <input checked="" type="checkbox"/> D BaCl_2 is $\text{Ba}^{2+}(\text{Cl}^-)_2 \therefore$ 1 mol BaCl_2 formula units contains 1 mol of positive Ba^{2+} ions
12	D	62	no. of moles of $\text{K}_2\text{Cr}_2\text{O}_7 = \text{volume} \times \text{concentration} = 0.025 \times 0.1 = 0.0025 \text{ mol Cr}_2\text{O}_7^{2-}$ ions Equation ①: $\text{Cr}_2\text{O}_7^{2-} + 14\text{H}^+ + 6\text{e}^- \rightarrow 2\text{Cr}^{3+} + 7\text{H}_2\text{O}$ Equation ②x6: $6\text{Fe}^{2+} \rightarrow 6\text{Fe}^{3+} + 6\text{e}^-$ Add ①+②: $\text{Cr}_2\text{O}_7^{2-} + 14\text{H}^+ + 6\text{Fe}^{2+} \rightarrow 2\text{Cr}^{3+} + 7\text{H}_2\text{O} + 6\text{Fe}^{3+}$ $\begin{array}{ccc} 1\text{mol} & 6\text{mol} & \\ 0.0025\text{mol} & 0.015\text{mol} & \end{array}$
13	A	76	<input checked="" type="checkbox"/> A removal of H^+ by neutralisation \therefore removal of product \therefore more forward reaction (dissociation) <input checked="" type="checkbox"/> B addition of H^+ \therefore addition of product \therefore more reverse reaction to remove product <input checked="" type="checkbox"/> C addition of catalyst would not change proportions of products at equilibrium <input checked="" type="checkbox"/> D addition of H_2PO_4^- \therefore addition of product \therefore more reverse reaction to remove product
14	C	63	$\text{PCl}_5(\text{g}) \rightleftharpoons \text{PCl}_3(\text{g}) + \text{Cl}_2(\text{g})$ $\begin{array}{ccc} 1\text{mol} & 1\text{mol} & 1\text{mol} \\ 0.5\text{mol} & 0.5\text{mol} & 0.5\text{mol} \end{array}$ But equilibrium concentration of $\text{PCl}_5 = 0.5 \text{ mol}$ Final volume = 0.5 mol PCl_5 remaining + 0.5 mol PCl_3 produced + 0.5 mol Cl_2 produced = 1.5 mol gas

15	A	76	Titration of weak acid (CH ₃ COOH) and strong alkali (NaOH) ∴ neutralisation occurs at alkaline pH (i.e. pH>7) ∴ Indicator used should be at pH range above 7
16	B	63	<input checked="" type="checkbox"/> A as acid is diluted, pH increases to pH=7 <input checked="" type="checkbox"/> B [H ⁺] decreases as acid is diluted <input checked="" type="checkbox"/> C pK _a remains constant during dilution <input checked="" type="checkbox"/> D degree of dissociation remains constant during dilution
17	B	51	<input checked="" type="checkbox"/> A [OH ⁻] = 10 ⁻¹⁴ ∴ [H ⁺] = 10 ⁰ ∴ pH=0 <input checked="" type="checkbox"/> B [OH ⁻] = 10 ⁰ ∴ [H ⁺] = 10 ⁻¹⁴ ∴ pH=14 <input checked="" type="checkbox"/> C [OH ⁻] = 10 ¹ ∴ [H ⁺] = 10 ⁻¹⁵ ∴ pH=15 <input checked="" type="checkbox"/> D [OH ⁻] = 10 ¹⁴ ∴ [H ⁺] = 10 ⁻²⁸ ∴ pH=28 (obviously not the correct answer)
18	D	72	<input checked="" type="checkbox"/> A Bond enthalpy equation should only break O-H bonds. (H ₂ in equation ∴ H-H bond is formed) <input checked="" type="checkbox"/> B H ₂ O → O + 2H is breaking 2x O-H bonds ∴ ΔH = 2x O-H bond enthalpy = 2X <input checked="" type="checkbox"/> C Bond enthalpy equation should only break O-H bonds. (H ₂ in equation ∴ H-H bond is formed) <input checked="" type="checkbox"/> D H ₂ O → O + 2H is breaking 2x O-H bonds ∴ ΔH = 2x O-H bond enthalpy = 2X
19	D	49	<input checked="" type="checkbox"/> A ΔH ₂ : Na(s) → Na(g) = enthalpy of atomisation of sodium = +107kJ mol ⁻¹ <input checked="" type="checkbox"/> B ΔH ₃ : ½Cl ₂ (g) → Cl(g) = ½x bond enthalpy of chlorine = ½x 243 = +121.5kJ mol ⁻¹ <input checked="" type="checkbox"/> C ΔH ₄ : Cl(g) + e ⁻ → Cl ⁻ (g) = enthalpy of electron affinity = -349kJ mol ⁻¹ <input checked="" type="checkbox"/> D ΔH ₅ : Na(g) → Na ⁺ (g) + e ⁻ = enthalpy of 1 st ionisation = +496kJ mol ⁻¹
20	D	79	<input checked="" type="checkbox"/> A ΔH ₃ is endothermic <input checked="" type="checkbox"/> B ΔH ₄ is exothermic <input checked="" type="checkbox"/> C ΔH ₅ is endothermic <input checked="" type="checkbox"/> D ΔH ₆ is enthalpy of lattice formation which is always exothermic and large
21	D	65	<input checked="" type="checkbox"/> A not enough information to make decision (need information on slow RDS step) <input checked="" type="checkbox"/> B overall order is 3 rd order (1+2=3) <input checked="" type="checkbox"/> C Order of Q = 2 nd order ∴ double [Q] → rate increase x4 <input checked="" type="checkbox"/> D In all reactions, as reaction proceeds the reaction slows down.
22	C	58	$\underbrace{\Delta G^\circ}_{\text{negative value}} = \underbrace{\Delta H^\circ}_{\text{X}} - \underbrace{T \times \Delta S^\circ}_{-T \times (\text{negative } \Delta S^\circ)}$ $\text{negative value} = \text{X} + (\text{positive value})$ <p>∴ ΔH^o = X = (negative value) - (positive value) = negative value = exothermic</p>
23	B	93	Electrons flow from metal M to Ag in diagram $\textcircled{1} \times -1 \quad \quad \quad \text{M} \rightarrow \text{M}^{2+} + 2\text{e}^- \quad \quad \quad E^\circ = \text{X}$ $\textcircled{2} \times 2 \quad 2\text{Ag}^+ + 2\text{e}^- \rightarrow 2\text{Ag} \quad \quad \quad \underline{E^\circ = 0.80\text{V}}$ $\textcircled{1}' + \textcircled{2}' \quad \text{M} + 2\text{Ag}^{2+} \rightarrow \text{M}^{2+} + 2\text{Ag} \quad \quad \quad \underline{E^\circ = 1.03\text{V}}$ <p>0.8V + X = 1.03V ∴ X = 0.8V - 1.03V = +0.23V ∴ M²⁺ + 2e⁻ → M E^o = -0.23V ∴ M is Nickel Ni (p12 databooklet) (in old data booklet Ni²⁺ was 0.23V now 0.26V)</p>
24	D	70	E ^o = 1.03V: M + 2Ag ²⁺ → M ²⁺ + 2Ag where 2 mol of e ⁻ are transferred in redox reaction: ΔG ^o = -nFE ^o = -2 x 96500 x 1.03 = -198790 J mol ⁻¹ = -198.8kJ mol ⁻¹
25	C	48	Cl ⁻ (_{aq}) ions from salt bridge will precipitate with Ag ⁺ (_{aq}) ions in beaker to form Ag ⁺ Cl ⁻ (_s) in the salt bridge which could stop the salt bridge from completing the circuit effectively.
26	D	82	Positive entropy change ΔS ^o is an increase in entropy ∴ an increase in disorder <input checked="" type="checkbox"/> A Decrease in disorder as H ₂ O molecules become very ordered as they freeze and line up. <input checked="" type="checkbox"/> B Two gases becoming a solid is a decrease in disorder <input checked="" type="checkbox"/> C Many gas monomer molecules becoming one large solid polymer is a decrease in disorder <input checked="" type="checkbox"/> D Solid NH ₄ NO ₃ becoming three gases is a large increase in disorder
27	B	40	<input checked="" type="checkbox"/> A Amino -NH ₂ group would react with acid but not alkali <input checked="" type="checkbox"/> B Amino -NH ₂ group would react with HCl(_{aq}) and carboxyl -COOH group would react with NaOH(_{aq}) <input checked="" type="checkbox"/> C Amine -NH ₂ group would react with acid but not alkali <input checked="" type="checkbox"/> D Substituted ammonium ion (CH ₃ CH ₂ NH ₃ ⁺) will react with alkali but not acid

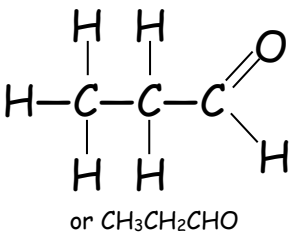

28	D	53	<input checked="" type="checkbox"/> A $C_4H_9NH_2$: Primary Amine \rightarrow two N-H bonds \rightarrow hydrogen bonding \therefore raised boiling point <input checked="" type="checkbox"/> B $C_3H_7NHCH_3$: Secondary Amine \rightarrow N-H bond \rightarrow hydrogen bonding \therefore raised boiling point <input checked="" type="checkbox"/> C $C_2H_5NHC_2H_5$: Secondary Amine \rightarrow N-H bond \rightarrow hydrogen bonding \therefore raised boiling point <input checked="" type="checkbox"/> D $C_2H_5N(CH_3)_2$: Tertiary Amine \rightarrow no N-H bonds \rightarrow no hydrogen bonding \therefore lower boiling point																					
29	B	71	There are no C=C double bonds for addition reactions in methane and chlorine. Homolytic fission, free radical formation and a chain reaction are all found in the reaction of methane with chlorine.																					
30	A	57	<input checked="" type="checkbox"/> A Lower melting point of oils caused by shape of C=C double bonds keeping oil molecules apart <input checked="" type="checkbox"/> B Pure ethanoic acid molecules have hydrogen bonding between the -COOH groups in their dimers <input checked="" type="checkbox"/> C methanol has hydrogen bonding due to its -OH group but alkanes have no hydrogen bonding <input checked="" type="checkbox"/> D propanone is miscible (mixes) with water as the hydrogen bonding of water interacts with Propanone due to similar shape and polar carbonyl group. NB pure propanone has no hydrogen bonding.																					
31	D	70	<input checked="" type="checkbox"/> A methoxymethane (ether) is more volatile than ethanol (ethers have lower boiling points than alkanols) <input checked="" type="checkbox"/> B ethers are not as reactive when compared to alkanols <input checked="" type="checkbox"/> C Ethers have peak at $1070-1150\text{cm}^{-1}$ (C-O-C) and alkanols have a peak at $3200-3570\text{cm}^{-1}$ (-OH group) <input checked="" type="checkbox"/> D Both have formula C_2H_6O \therefore burn to form same products: $C_2H_6O + 3O_2 \rightarrow 2CO_2 + 3H_2O$																					
32	A	81	<table border="1" style="display: inline-table; margin-right: 20px;"> <thead> <tr> <th>Bond Type</th> <th>C - C</th> <th>C = C</th> <th>C \equiv C</th> <th>C - H</th> </tr> </thead> <tbody> <tr> <td>Sigma σ</td> <td>1</td> <td>1</td> <td>1</td> <td>1</td> </tr> <tr> <td>Pi π</td> <td>0</td> <td>1</td> <td>2</td> <td>0</td> </tr> </tbody> </table> $4x\text{C-H} + 1x\text{C-C} + 1x\text{C=C} + 1x\text{C}\equiv\text{C}$ $(4\sigma) + (1\sigma) + (1\sigma+1\pi) + (1\sigma+2\pi)$ $= 7\sigma + 3\pi$	Bond Type	C - C	C = C	C \equiv C	C - H	Sigma σ	1	1	1	1	Pi π	0	1	2	0						
Bond Type	C - C	C = C	C \equiv C	C - H																				
Sigma σ	1	1	1	1																				
Pi π	0	1	2	0																				
33	B	42	<input checked="" type="checkbox"/> A nucleophiles are attracted to the δ^+ carbon atom of the polar C-Br bond in CH_3CH_2Br (S_N2) <input checked="" type="checkbox"/> B Electrophiles, not nucleophiles, are attracted to the delocalised electrons in the benzene ring of C_6H_5Br <input checked="" type="checkbox"/> C nucleophiles are attracted to the positively charged carbocation intermediate $(CH_3)_3C^+$ (S_N1) <input checked="" type="checkbox"/> D nucleophiles are attracted to the δ^+ carbon atom of the polar C-Cl bond in $(CH_3)_2CHCl$ (S_N2)																					
34	C	55	<input checked="" type="checkbox"/> A Aldehydes oxidise to form alkanoic acids. Alkanoic acids are acidic when dissolved in water. <input checked="" type="checkbox"/> B Ketones do not oxidise with hot copper (II) oxide. <input checked="" type="checkbox"/> C Secondary alcohols oxidise to form ketones. Ketones are neutral if dissolved in water. <input checked="" type="checkbox"/> D Tertiary alcohols do not oxidise with hot copper (II) oxide.																					
35	A	83	Tertiary halogenalkanes have 3 carbons directly attached to the carbon bonded to the halogen. <input checked="" type="checkbox"/> A $(CH_3)_3CBr$ is tertiary: 3 carbons directly attached to the carbon bonded to the halogen <input checked="" type="checkbox"/> B $CHBr_3$ has no carbons attached to the carbon with the halogen bond (i.e. not a tertiary halogenalkane) <input checked="" type="checkbox"/> C $CH(CH_2Br)_3$: each C in a C-Br bond has 1 carbon attached to the carbon with the Br atom. <input checked="" type="checkbox"/> D $(CH_3)_3CCH_2Br$ is primary: 1 carbon directly attached to the carbon bonded to the halogen																					
36	A	92	Every corner is a carbon (14 corners \rightarrow C_{14}). Every 2 point corner has a C-H bond (10x 2point corners \rightarrow H_{10})																					
37	C	70	<input checked="" type="checkbox"/> A The delocalised electrons in benzene attract electrophiles <input checked="" type="checkbox"/> B $H_2SO_4 + HNO_3$ produces NO_2^+ ions which electrophilically attack the benzene ring <input checked="" type="checkbox"/> C $H_2SO_4 + HNO_3$ produces NO_2^+ ions which electrophilically attack the benzene ring <input checked="" type="checkbox"/> D no oxidation of HNO_3 in mechanism																					
38	A	37	CH_3Cl heterolytically splits to form CH_3^+ ions in the presence of $AlCl_3$ catalyst. CH_3^+ electrophilically attack benzene ring and substitute onto the ring.																					
39	A	75	Markovnikov's Rule: H atom of HCl adds onto the C in the C=C bond which has the higher number of hydrogens already attached to it: 2-methylpent-2-ene + HCl \rightarrow 2chloro-2-methylpentane H adds onto C_3 in 2-methylpent-2-ene (C_3 has 1 hydrogen atom attached to it) Cl adds onto C_2 in 2-methylpent-2-ene (C_2 has no hydrogens attached to it)																					
40	C	54	<table style="width: 100%; border-collapse: collapse;"> <tbody> <tr> <td style="width: 5%; text-align: center;">①</td> <td style="width: 50%;">$2C(s) + 2H_2(g) \rightarrow C_2H_4(g)$</td> <td style="width: 45%;">Enthalpy of formation for ethane (data required)</td> </tr> <tr> <td style="text-align: center;">②</td> <td>$C(s) \rightarrow C(g)$</td> <td>Enthalpy of sublimation (atomisation) (data required)</td> </tr> <tr> <td style="text-align: center;">③</td> <td>$H_2(g) \rightarrow 2H(g)$</td> <td>Bond Enthalpy for H_2 (data required)</td> </tr> <tr> <td style="text-align: center;">①x-1</td> <td>$C_2H_4(g) \rightarrow 2C(s) + 2H_2(g)$</td> <td></td> </tr> <tr> <td style="text-align: center;">②x2</td> <td>$C(s) \rightarrow C(g)$</td> <td></td> </tr> <tr> <td style="text-align: center;">③x2</td> <td>$H_2(g) \rightarrow 2H(g)$</td> <td></td> </tr> <tr> <td style="text-align: center;">①'+②'+③'</td> <td>$C_2H_4(g) \rightarrow 2C(g) + 4H(g)$</td> <td>Equals the bond enthalpies for: $4x\text{C-H} + 1x\text{C=C}$ (data required) to be calculated </td> </tr> </tbody> </table>	①	$2C(s) + 2H_2(g) \rightarrow C_2H_4(g)$	Enthalpy of formation for ethane (data required)	②	$C(s) \rightarrow C(g)$	Enthalpy of sublimation (atomisation) (data required)	③	$H_2(g) \rightarrow 2H(g)$	Bond Enthalpy for H_2 (data required)	①x-1	$C_2H_4(g) \rightarrow 2C(s) + 2H_2(g)$		②x2	$C(s) \rightarrow C(g)$		③x2	$H_2(g) \rightarrow 2H(g)$		①'+②'+③'	$C_2H_4(g) \rightarrow 2C(g) + 4H(g)$	Equals the bond enthalpies for: $4x\text{C-H} + 1x\text{C=C}$ (data required) to be calculated
①	$2C(s) + 2H_2(g) \rightarrow C_2H_4(g)$	Enthalpy of formation for ethane (data required)																						
②	$C(s) \rightarrow C(g)$	Enthalpy of sublimation (atomisation) (data required)																						
③	$H_2(g) \rightarrow 2H(g)$	Bond Enthalpy for H_2 (data required)																						
①x-1	$C_2H_4(g) \rightarrow 2C(s) + 2H_2(g)$																							
②x2	$C(s) \rightarrow C(g)$																							
③x2	$H_2(g) \rightarrow 2H(g)$																							
①'+②'+③'	$C_2H_4(g) \rightarrow 2C(g) + 4H(g)$	Equals the bond enthalpies for: $4x\text{C-H} + 1x\text{C=C}$ (data required) to be calculated																						

2003 Adv Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning
1a	Same atom provides both electrons in a bond	A dative covalent bond is when a lone pair on an atom provides both the electrons which are shared between two atoms in a covalent bond e.g. $\text{H}^+ + \text{:NH}_3 \longrightarrow \text{NH}_4^+$
1b	$\begin{array}{c} \text{H} \\ \bullet \times \\ \text{H} \times \text{N} \times \text{H} \\ \times \bullet \\ \text{H} \end{array}$	where \times is electron from N and \bullet is electron from H
1c		All 4 bonds (including the dative covalent bond) are equal and indistinguishable from each other. The tetrahedral shape formed has a bond angle of 109.5° between all of the bonds. Positive charge spread evenly over whole ion
2a	0.0055mol	$\begin{array}{ccccccc} \text{NaOH} & + & \text{HCl} & \longrightarrow & \text{NaCl} & + & \text{H}_2\text{O} \\ 1\text{mol} & & 1\text{mol} & & & & \\ 0.000891\text{mol} & & 0.000891\text{mol} & & & & \end{array}$ <p>Total no. of mol HCl = $v \times c = 0.04 \text{ litres} \times 0.16 \text{ mol l}^{-1} = 0.0064\text{mol}$ no. of mol of HCl not used in neutralisation of $\text{MgCO}_3 = 0.000891\text{mol}$ no. of mol of HCl used in neutralisation of $\text{MgCO}_3 = 0.0064 - 0.000891 = 0.005509\text{mol}$</p>
2b(i)	$\begin{array}{c} \text{MgCO}_3 + 2\text{HCl} \\ \downarrow \\ \text{MgCl}_2 + \text{H}_2\text{O} + \text{CO}_2 \end{array}$	$\text{MgCO}_3 + 2\text{HCl} \longrightarrow \text{MgCl}_2 + \text{H}_2\text{O} + \text{CO}_2$
2b(ii)	92.8%	$\begin{array}{ccccccc} \text{MgCO}_3 & + & 2\text{HCl} & \longrightarrow & \text{MgCl}_2 & + & \text{H}_2\text{O} + \text{CO}_2 \\ 1\text{mol} & & 2\text{mol} & & & & \\ 0.002755\text{mol} & & 0.005509\text{mol} & & & & \end{array}$ <p>1 mol $\text{MgCO}_3 = (1 \times 24.3) + (1 \times 12) + (3 \times 16) = 24.3 + 12 + 48 = 84.3\text{g}$ mass = no. of mol \times gfm = $0.002755\text{mol} \times 84.3\text{g} = 0.2322\text{g MgCO}_3$ $\% \text{purity} = \frac{\text{mass of pure}}{\text{mass of impure}} \times 100 = \frac{0.2322}{0.25} \times 100 = 92.8\%$</p>
3a	SiO_2	SiO_2 is the only covalent network oxide in the table: <input checked="" type="checkbox"/> high melting point <input checked="" type="checkbox"/> non-metals only in oxide
3b(i)	Can react as an acid or a base	Al_2O_3 is amphoteric as it reacts as an acidic oxide and a basic oxide e.g.
3b(ii)	Al_2O_3	as a base: $\text{Al}_2\text{O}_3 + 6\text{HCl} \longrightarrow 2\text{AlCl}_3 + 3\text{H}_2\text{O}$ as an acid: $\text{Al}_2\text{O}_3 + 3\text{H}_2\text{O} + 2\text{NaOH} \longrightarrow 2\text{NaAl(OH)}_4$
3c		$\text{No of electron pairs} = \frac{\text{No. of outer electrons in central atom} + \text{No. of bonds} - \text{charge}}{2}$ $= \frac{6 + 2 - 0}{2}$ $= \frac{8}{2} = 4 \text{ electron pairs} \therefore \text{tetrahedral arrangement of electrons}$ <p style="text-align: center;">2 bonding pairs and 2 lone pairs \therefore angular shape</p>

4a	6	 <p>Oxalate $C_2O_4^{2-}$ ion is a bidentate ligand 3 oxalate ions surround Fe^{3+} ion co-ordination number=6</p>																								
4b	Acts as oxidising agent (oxidises $Fe^{2+} \rightarrow Fe^{3+}$)	$Fe^{2+}(C_2O_4)^{2-}$ has Fe^{2+} ions $K_3[Fe(C_2O_4)_3]$ and $Fe(OH)_3$ both contain Fe^{3+} ions Oxidation: $Fe^{2+} \rightarrow Fe^{3+} + e^-$ carried out by an oxidising agent

7a	C=O (carbonyl)	The C=O group in an aldehyde (RCHO) causes an adsorption at 1730cm ⁻¹				
7b	C ₂ H ₅ ⁺ or CHO ⁺ (accept: C ₂ H ₅ or CHO)	C ₂ H ₅ = (2×12)+(5×1) = 24+5 = 29 CHO = (1×12)+(1×1)+(1×16) = 12+1+16 = 29				
7c	X:Y:Z = 3:2:1	Areas under peak are multiples of 25				

7d		Evidence from	Reasoning		
		part(a) IR spec	Peak at 1730cm ⁻¹ ∴ CHO group		
		part(b) Mass spec	C ₂ H ₅ - group and CHO- groups both weigh 29		
		Part (c) NMR	Chemical Shift	No. of H atoms	Group
		1.1	3	-CH ₃	
		2.5	2	-CH ₂ -	
		9.8	1	-CHO	
7e	Forms a solid (derivative) which has certain melting point	Brady's Reagent forms a white crystalline derivative solid with aldehydes and ketones only which distinctive melting points which can be measured on melting point apparatus.			
8a	Answer should include:	Agonists bind with the active site and produces a biological response. Antagonists bind with the active site and inhibit a biological response.			
8b	Answer should include:	Pharmacophores are the specific shape of a chemical which fits into a receptor to cause or inhibit a biological response. Molecules which fit the receptor have the same pharmacophore shape whether it gives the biological response inside the cell or not.			
9a	Rate = k [H ₂ O ₂][I ⁻]	Experiments	Change in conditions	Effect on Rate	Order
		1+2	[H ₂ O ₂] × 2	×2	[H ₂ O ₂] ¹
		1+3	[I ⁻] × 2	×2	[I ⁻] ¹
		1+4	[H ⁺] × 2	No change	[H ⁺] ⁰
		Rate = k [H ₂ O ₂] ¹ [I ⁻] ¹ [H ⁺] ⁰ ∴ Rate = k [H ₂ O ₂][I ⁻]			
9b	2.3×10 ² l mol ⁻¹ s ⁻¹	Rate = k [H ₂ O ₂][I ⁻] $k = \frac{\text{rate}}{[\text{H}_2\text{O}_2][\text{I}^-]} = \frac{2.07 \times 10^{-3} \text{ mol l}^{-1} \text{ s}^{-1}}{(0.3 \text{ mol l}^{-1}) \times (0.3 \text{ mol l}^{-1})} = 2.3 \times 10^2 \text{ l mol}^{-1} \text{ s}^{-1}$			
10a	-81.2	$\Delta S^\circ = \sum S^\circ(\text{products}) - \sum S^\circ(\text{reactants})$ $= (2 \times 69.9) + (213.8) - (127.0 + (1.5 \times 205.2))$ $= 353.6 - 434.8 = -81.2 \text{ J K}^{-1} \text{ mol}^{-1}$			
10b	-720.8	$\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ$ $= -727 - (298 \times -81.2/1000)$ $= -727 - (-24.2)$ $\Delta G^\circ = -720.8 \text{ kJ mol}^{-1}$			
10c	O ₂ +4H ⁺ +4e ⁻ → 2H ₂ O	Redox Reaction	CH ₃ OH + 3/2O ₂ → CO ₂ + 2H ₂ O		
		Separate half-equations	CH ₃ OH + 3/2O ₂ → CO ₂ + 2H ₂ O From Data Booklet:		
		Balance reduction reaction	4H ⁺ + 4e ⁻ + O ₂ → 2H ₂ O		
10d	H ⁺ ion	H ⁺ ions are products in the oxidation reaction H ⁺ ions are reactants ion the reduction reaction			
11a	2.80	$\text{pH} = \frac{1}{2}\text{pK}_a - \frac{1}{2}\log_{10}c$ $= \frac{1}{2}(4.9) - \frac{1}{2}\log_{10}(0.2)$ $= 2.45 - (-0.35)$ $= 2.80$			
11b	Answer should include:	A buffer had been created. Octanoate ions created by partial neutralisation with NaOH will mop up H ⁺ ions from the added HCl solution: Octanoate ions + H ⁺ ⇌ Octanoic acid			
12a	3×10 ⁻⁶ or 0.000003	$K_{\text{In}^-} = \frac{[\text{H}^+][\text{In}^-]}{[\text{HIn}]} = \frac{10^{-7} \times (3.9 \times 10^{-4})}{1.3 \times 10^{-5}} = 3 \times 10^{-6}$			
12b	Yellow	At pH > 7, [In ⁻] > [HIn] as H ⁺ ions have reacted with alkali At pH < 7, [HIn] > [In ⁻] as H ⁺ ions have joined up with In ⁻ ions
