Grade Awarded	Mark Required		% candidates achieving grade
	(/125)	%	
A	87+	70%	20.9%
B	71+	57%	23.9%
C	56+	45%	27.5%
D	48+	38%	10.5%
No award	<48	<48%	17.1%

2004 Adv Higher Chemistry Marking Scheme

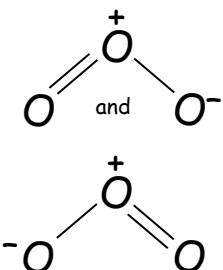

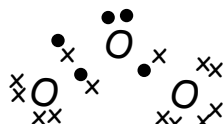

MC Qu	Correct Answer	% Correct	Reasoning
1	D	88	<input checked="" type="checkbox"/> A 4s fills then 3d then 4p <input checked="" type="checkbox"/> B 3s fills then 3p then 4s then 3d <input checked="" type="checkbox"/> C 3p fills then 4s then 3d then 4p <input checked="" type="checkbox"/> D $1s \rightarrow 2s \rightarrow 2p \rightarrow 3s \rightarrow 3p \rightarrow 4s \rightarrow 3d \rightarrow 4p$
2	C	65	<input checked="" type="checkbox"/> A Boron has no lone pairs in outer shell as it is group 3 <input checked="" type="checkbox"/> B Nitrogen has a lone pair but it is already donated the pair in NH_4^+ <input checked="" type="checkbox"/> C Phosphorus is in group 5 and has a lone pair of electrons to donate in PH_3 <input checked="" type="checkbox"/> D Co^{3+} ions will not be attracted to H^+ ions as the Co^{3+} ion has a positive charge.
3	B	64	<input checked="" type="checkbox"/> A NaCl has 6:6 co-ordination <input checked="" type="checkbox"/> B CsCl has 8:8 co-ordination <input checked="" type="checkbox"/> C NaCl has 6:6 co-ordination <input checked="" type="checkbox"/> D CsCl has 8:8 co-ordination
4	D	83	Aluminium oxide is amphoteric as it acts as both a basic oxide and an acidic oxide
5	D	74	<input checked="" type="checkbox"/> A NH_3 is polar covalent not ionic <input checked="" type="checkbox"/> B HCl(g) is polar covalent and HCl(aq) contains the H^+ hydrogen ion not the H^- hydride ion <input checked="" type="checkbox"/> C H_2S is non-polar covalent <input checked="" type="checkbox"/> D CaH_2 is ionic and contains the hydride H^- ion
6	B	57	No. of electron pairs = $(\text{no. of outer electrons in central atom} + \text{no. of bonds})/2 = (5+3)/2 = 8/2$ = 4 pairs of electrons \therefore tetrahedral electron pair shape
7	C	56	No. of electron pairs = $(\text{no. of outer electrons in central atom} + \text{no. of bonds})/2 = (7+3)/2 = 10/2$ = 5 pairs of electrons \therefore trigonal bipyramidal electron pair shape
8	B	47	Ni atom has electron arrangement: $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^8$ Ni^{2+} ion has electron arrangement: $1s^2 2s^2 2p^6 3s^2 3p^6 3d^8$ (NB: 4s before 3d) $3d^8$ in Ni^{2+} has 3 pairs and 2 unpaired electrons
9	D	54	Zn^{2+} ion has a complete $3d^{10}$ subshell so there is no room for $d \rightarrow d$ transitions and hence no visible wavelength light absorbed for the complementary colour to be viewed by the human eye.
10	C	77	1. Balance all atoms other than O + H: $\text{ClO}_3^- \rightarrow \text{Cl}^-$ 2. Balance O by adding H_2O to other side: $\text{ClO}_3^- \rightarrow \text{Cl}^- + 3\text{H}_2\text{O}$ 3. Balance H by adding H^+ to the other side: $\text{ClO}_3^- + 6\text{H}^+ \rightarrow \text{Cl}^- + 3\text{H}_2\text{O}$ 4. Balance charge by adding e^- to most positive side: $\text{ClO}_3^- + 6\text{H}^+ + 6e^- \rightarrow \text{Cl}^- + 3\text{H}_2\text{O}$
11	B	52	no. of moles of Na^+ ions = $v \times c = 1 \text{ litre} \times 0.2 \text{ mol l}^{-1} = 0.2 \text{ mol Na}^+$ ions But 2 Na^+ ions per Na_2CO_3 formula unit \therefore no. of moles of $\text{Na}_2\text{CO}_3 = 0.1 \text{ mol}$ $\text{volume} = \frac{\text{no of moles}}{\text{concentration}} = \frac{0.1}{0.5} = 0.2 \text{ litres} = 200 \text{ cm}^3$
12	D	83	<input checked="" type="checkbox"/> A For this equilibrium, if $K=1$ then $[\text{reactants}] = [\text{products}]$ which rarely happens <input checked="" type="checkbox"/> B At equilibrium, concentrations of reactants and products are rarely equal <input checked="" type="checkbox"/> C At equilibrium, both forward and reverse reaction proceed equally <input checked="" type="checkbox"/> D Rate of forward reaction (esterification) = rate of reverse reaction (hydrolysis)
13	A	77	Pressure: forward reaction increased pressure \therefore low pressure favours forward reaction. Temperature: forward reaction is endothermic \therefore high temperature favours forward reaction.
14	C	74	<input checked="" type="checkbox"/> A Adding more cyclohexane does not change the proportion of Iodine in each layer. <input checked="" type="checkbox"/> B Adding more iodine does not alter partition coefficient as iodine splits between layers in the same ratio <input checked="" type="checkbox"/> C Temperature does change partition coefficient <input checked="" type="checkbox"/> D Shaking the mixture thoroughly achieves partition faster but still the same coefficient.

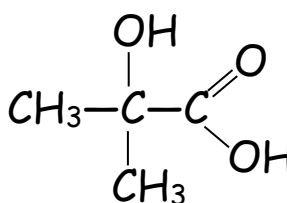

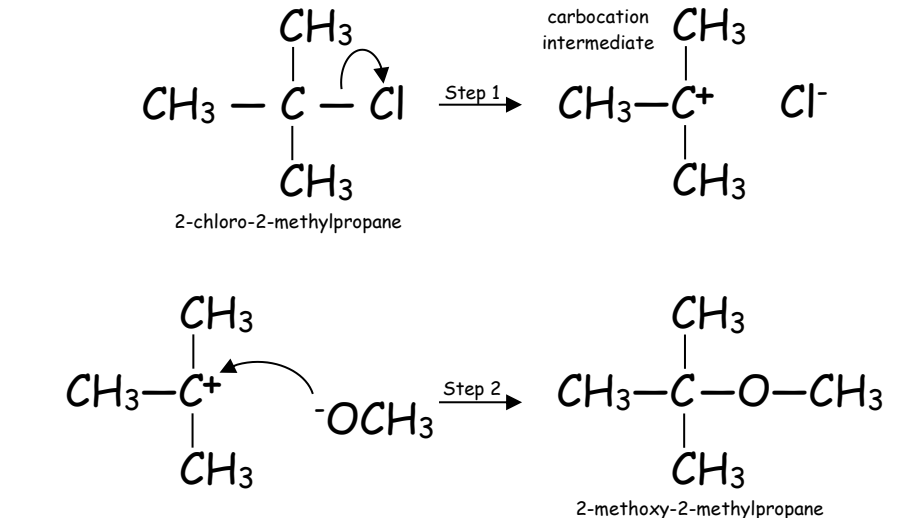

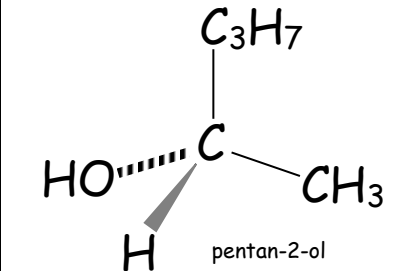

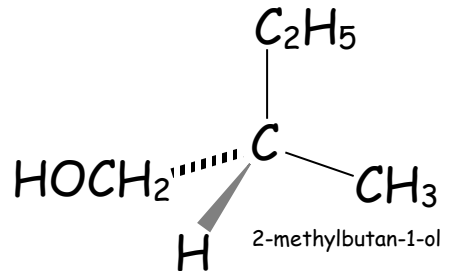

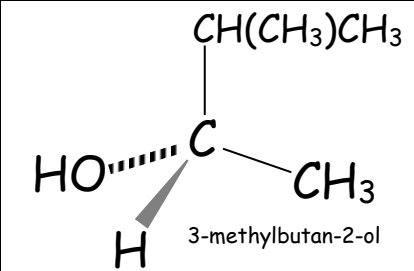

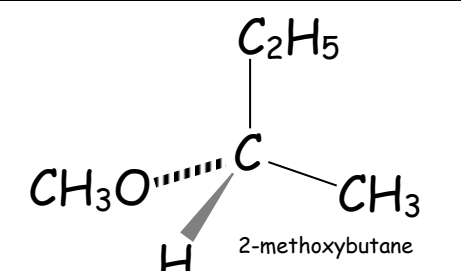

15	B	54	$\begin{array}{l} \textcircled{1} \times -2 \quad 2\text{NO}_2 \rightarrow \text{N}_2 + 2\text{O}_2 \quad \Delta G^\circ = -103.6 \text{kJ mol}^{-1} \\ \textcircled{2} \quad \text{N}_2 + 2\text{O}_2 \rightarrow \text{N}_2\text{O}_4 \quad \Delta G^\circ = +97.7 \text{kJ mol}^{-1} \\ \text{Add } \textcircled{1}' + \textcircled{2} \quad 2\text{NO}_2 \rightarrow \text{N}_2\text{O}_4 \quad \Delta G^\circ = -5.9 \text{kJ mol}^{-1} \end{array}$
16	B	68	<input checked="" type="checkbox"/> A reactant Sr(g) must be a solid at standard conditions for enthalpy of formation <input checked="" type="checkbox"/> B Enthalpy of formation: Forming one mole of a substance from its elements in their natural state <input checked="" type="checkbox"/> C This is the enthalpy of lattice formation <input checked="" type="checkbox"/> D This equation is the reverse of the enthalpy of solution
17	B	69	$\Delta H^\circ = +1944 \text{kJ mol}^{-1} \therefore 4 \times \text{C-F bonds must be broken to be endothermic } (4 \times +486 \text{kJ mol}^{-1})$ <input checked="" type="checkbox"/> A In addition to 4x C-F bonds being broken, $\text{C(g)} \rightarrow \text{C(s)}$ and $4\text{F(g)} \rightarrow 2\text{F}_2\text{(g)}$ which are both exothermic <input checked="" type="checkbox"/> B Only 4x C-F bonds being broken in this equation. <input checked="" type="checkbox"/> C In addition to 4x C-F bonds being broken, $4\text{F(g)} \rightarrow 2\text{F}_2\text{(g)}$ which is exothermic <input checked="" type="checkbox"/> D In addition to 4x C-F bonds being broken, $\text{C(g)} \rightarrow \text{C(s)}$ which is exothermic
18	C	77	Each ionisation energy involves the removal of 1 electron so add 1 st + 2 nd + 3 rd ionisation energies $\Delta H^\circ = 1^{\text{st}} + 2^{\text{nd}} + 3^{\text{rd}}$ ionisation energies for Cr = 659 + 1600 + 3000 = +5259 kJ mol ⁻¹ <small>(Current data booklet is Cr = 653. +. 1591. +. 2987 = +5231 kJ mol⁻¹)</small>
19	A	59	<input checked="" type="checkbox"/> A Chlorine atoms do not lose electrons to become positive ions, they gain electrons to become negative <input checked="" type="checkbox"/> B enthalpy of formation is required to calculate the lattice enthalpy (and vice versa) <input checked="" type="checkbox"/> C Gaseous sodium atoms need to become 1+ positive ions <input checked="" type="checkbox"/> D Bonds in Cl ₂ need to break before Chlorine atoms can be negative ions.
20	C	76	<input checked="" type="checkbox"/> A Enthalpy of Formation for LiBr: $\text{Li(s)} + \frac{1}{2}\text{Br}_2\text{(l)} \rightarrow \text{Li}^+\text{Br}^-\text{(s)}$ <input checked="" type="checkbox"/> B Enthalpy of solution for LiBr: $\text{Li}^+\text{Br}^-\text{(s)} \rightarrow \text{Li}^+\text{(aq)} + \text{Br}^-\text{(aq)}$ <input checked="" type="checkbox"/> C Hydration Enthalpies a) Lithium ion: $\text{Li}^+\text{(g)} \rightarrow \text{Li}^+\text{(aq)}$ b) Bromide ion: $\text{Br}^-\text{(g)} \rightarrow \text{Br}^-\text{(aq)}$ <input checked="" type="checkbox"/> D Li ⁺ and Br ⁻ are already ions so do not need to further ionised
21	C	41	<input checked="" type="checkbox"/> A Gases have a higher degree of disorder than liquids <input checked="" type="checkbox"/> B Gases have a higher degree of disorder than liquids <input checked="" type="checkbox"/> C Liquid Water is the least disordered as it has hydrogen bonding and polar attractions <input checked="" type="checkbox"/> D Non-polar liquid bromine molecules are more disordered than polar liquid water molecules
22	A	43	$\Delta G^\circ = \underbrace{\Delta H^\circ}_{\text{(positive } \Delta H^\circ)} - \underbrace{T \times \Delta S^\circ}_{-T \times \text{(negative } \Delta S^\circ)}$ $\Delta G^\circ = \text{(positive value)} + \text{(positive value)} = \text{positive value (thermodynamically not feasible)}$
23	C	60	If K is large and positive then equilibrium lies well to the right and ΔG° is negative for forward reaction <input checked="" type="checkbox"/> A ΔG° is positive for reverse reaction <input checked="" type="checkbox"/> B ΔG° is large and negative as K is very large <input checked="" type="checkbox"/> C Equilibrium lies so far to right side that very little reverse reaction occurs <input checked="" type="checkbox"/> D K is temperature dependent
24	A	59	$\begin{array}{l} \textcircled{1} \times -1 \quad \text{Ti}^{2+} \rightarrow \text{Ti}^{3+} + e^- \quad E^\circ = +0.37\text{V} \\ \textcircled{2} \quad \text{V}^{3+} + e^- \rightarrow \text{V}^{2+} \quad E^\circ = -0.26\text{V} \\ \text{Add } \textcircled{1}' + \textcircled{2} \quad \text{Ti}^{2+} + \text{V}^{3+} \rightarrow \text{Ti}^{3+} + \text{V}^{2+} \quad E^\circ = +0.11\text{V} \end{array}$ $\Delta G^\circ = -nFE^\circ = -1 \times 96500 \times 0.11 = -10615 \text{J mol}^{-1} = -10.615 \text{kJ mol}^{-1} = \text{negative}$ K > 1 as ΔG° is negative and reaction is feasible and equilibrium lies to right
25	A	66	N=2 as 2 moles of electrons are transferred in equation: $\text{X} + 2\text{Y}^+ \rightarrow \text{X}^{2+} + 2\text{Y}$ $\Delta G^\circ = -nFE^\circ = -2 \times 96500 \times 1.5 = -289500 \text{J mol}^{-1} = -289.5 \text{kJ mol}^{-1}$
26	B	70	$\begin{array}{l} \textcircled{1} \quad \text{MnO}_4^- + 4\text{H}^+ + 2e^- \rightarrow \text{MnO}_2 + 2\text{H}_2\text{O} \quad E^\circ = 2.26\text{V} \\ \textcircled{2} \times -2 \quad 2\text{Fe}^{2+} \rightarrow 2\text{Fe}^{3+} + 2e^- \quad E^\circ = -0.77\text{V} \quad E^\circ \text{ reverses but does not double} \\ \text{Add } \textcircled{1} + \textcircled{2}' \quad \text{MnO}_4^- + 4\text{H}^+ + 2\text{Fe}^{2+} \rightarrow \text{MnO}_2 + 2\text{H}_2\text{O} + 2\text{Fe}^{3+} \quad E^\circ = +1.49\text{V} \end{array}$
27	B	68	Rate kinetics are decided by the (slow) rate determining step: $\text{A} + \text{B} \rightarrow \text{AB}$ Order of reactant A = 1 and Order of reactant B = 1 \therefore rate = k [A] ¹ [B] ¹ \therefore rate = k [A][B]

28	A	63	<input checked="" type="checkbox"/> A This reaction is an elimination reaction (C=C formed as HBr is eliminated) <input type="checkbox"/> B Nucleophilic substitution (CN ⁻ on and Br ⁻ off) <input type="checkbox"/> C Nucleophilic substitution (C ₂ H ₅ O ⁻ on and Cl ⁻ off) <input type="checkbox"/> D Nucleophilic substitution (OH ⁻ on and Br ⁻ off)
29	B	65	<input type="checkbox"/> A Addition of HI across C=C double bond <input checked="" type="checkbox"/> B Light required to homolytically split Br ₂ into free radicals and free radical chain reaction begins <input type="checkbox"/> C Nucleophilic substitution (OH ⁻ on and Br ⁻ off) <input type="checkbox"/> D Electrophilic substitution (nitration of benzene)
30	D	66	<input type="checkbox"/> A Addition of HI across C=C double bond <input type="checkbox"/> B Light required to homolytically split Br ₂ into free radicals and free radical chain reaction begins <input type="checkbox"/> C Nucleophilic substitution (OH ⁻ on and Br ⁻ off) <input checked="" type="checkbox"/> D Electrophilic substitution (nitration of benzene)
31	A	51	<input checked="" type="checkbox"/> A NH ₃ has a lone pair of electrons which seeks out centres of positive charge <input type="checkbox"/> B NH ₄ ⁺ is not a nucleophile as it has no negative charge or lone pair of electrons <input type="checkbox"/> C Br ₂ has pure covalent bonding and cannot act as a nucleophile <input type="checkbox"/> D CH ₃ I has a polar C-I bond and the δ ⁺ charge on the C atom attracts nucleophiles
32	A	94	<input checked="" type="checkbox"/> A CH ₃ CH(CH ₃)CH(OH)CH ₂ CH ₃ → 2-methylpentan-3-ol <input type="checkbox"/> B CH ₃ CH(OH)CH(CH ₃)CH ₂ CH ₃ → 3-methylpentan-2-ol <input type="checkbox"/> C CH ₃ CH(CH ₃)CH(OH)CH ₃ → 3-methylbutan-2-ol (incorrect as it has 5 carbons) <input type="checkbox"/> D CH ₃ CH ₂ C(CH ₃) ₂ CH ₂ CH ₂ OH → 3,3-dimethylpentan-1-ol (incorrect as it has 7 carbons)
33	C	65	<input type="checkbox"/> A Primary Alcohol → would react with acidified dichromate solution <input type="checkbox"/> B Secondary Alcohol → would react with acidified dichromate solution <input checked="" type="checkbox"/> C Dehydrates to 2-methylpropene which would react with Br ₂ to form 1,2-dibromo-2-methylpropane <input type="checkbox"/> D 5 carbons on structure D and 1,2-dibromo-2-methylpropane has 4 carbons
34	D	64	<input type="checkbox"/> A The derivative must be stable and not decompose at its melting point <input type="checkbox"/> B Too low a relative molecular mass would mean the derivative is not a solid at room temp. <input type="checkbox"/> C Melting points are used to identify the derivative. <input checked="" type="checkbox"/> D A sharp melting point is required to identify the derivative by melting point.
35	D	43	<input type="checkbox"/> A Both substances are alcohols → Only aldehydes and ketones make derivatives <input type="checkbox"/> B Both substances are carboxylic acids → Only aldehydes and ketones make derivatives <input type="checkbox"/> C Both substances are ethers → Only aldehydes and ketones make derivatives <input checked="" type="checkbox"/> D ethanal and propanal are aldehydes → Only aldehydes and ketones make derivatives
36	A	33	Ester compound would hydrolyse with NaOH to form: a) diol: HO-CH ₂ CH ₂ -OH b) 2xCH ₂ COOH but CH ₃ COOH would be neutralised by NaOH to form CH ₃ COO ⁻ Na ⁺
37	D	80	<input type="checkbox"/> A CH ₃ COCH ₃ is an alkanone which has a neutral pH <input type="checkbox"/> B CH ₃ CH ₂ CN is a nitrile compound with a high pK _a value which means little acid/base activity <input type="checkbox"/> C CH ₃ CH ₂ CHO is an alkanal which has a neutral pH <input checked="" type="checkbox"/> D CH ₃ CH ₂ NH ₂ is an amine which has an alkaline pH
38	A	42	<input checked="" type="checkbox"/> A Benzene ring is planar and the single Chloro group lies in the same plane as the benzene ring <input type="checkbox"/> B Methyl group on methylbenzene is non-planar as three H in -CH ₃ lie outside the plane of the ring <input type="checkbox"/> C Cyclohexane is non-planar as the carbon ring has a 3D shape chair shape <input type="checkbox"/> D Hexane is non-planar as the carbons have a tetrahedral 3D shape
39	C	65	<input type="checkbox"/> A Proton NMR spectroscopy: the alignment of hydrogen nuclei spin in a magnetic field <input type="checkbox"/> B Emission Spectroscopy: Measuring the wavelengths produced when excited electrons drop down energy levels <input checked="" type="checkbox"/> C Infra-red Spectroscopy: Adsorption of IR wavelengths as energy is absorbed as groups within molecules vibrate <input type="checkbox"/> D Mass Spectroscopy: Separating charged particles through a magnetic field
40	D	64	<input type="checkbox"/> A Butan-1-ol and butan-2-ol are drawn and are different structures. <input type="checkbox"/> B trans-1,2-dibromoethene and cis-1,2-dibromoethene are drawn and are different 3D structures <input type="checkbox"/> C 2-methylbutane and 2,2-dimethylpropane are drawn and are different structures. <input checked="" type="checkbox"/> D both structures are 1,1,2-trichloroethane and are the same structure.

2004 Adv Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning												
1a(i)	Atoms get smaller or increasing nuclear charge on outer electrons	Across a period, the atoms get smaller due to the same outer shell being pulled in by the increasing nuclear charge. The outer electrons are harder to remove so the ionisation energy increases.												
1a(ii)	N is higher as it already has half-filled 2p orbital or O is lower as removing an electron creates a half filled 2p-orbital	Nitrogen is $1s^2 2s^2 2p^3$. Half filled p-orbitals are relatively stable and require more energy to remove an electron. Oxygen is $1s^2 2s^2 2p^4$. Removing one electron creates $2p^3$ on oxygen.												
1b	Removing an electron from Li^+ breaks into a full electron shell	2^{nd} Ionisation energy of Li: $Li^+(g) \rightarrow Li^{2+}(g) + e^-$ Removing an electron from Li^+ breaks a stable, complete outer shell of electrons which requires more energy.												
2a	-286 kJ mol ⁻¹	<table style="width: 100%; border: none;"> <thead> <tr> <th style="text-align: center; border: none;">Bond Breaking Steps</th> <th style="text-align: center; border: none;">Bond Forming Steps</th> </tr> </thead> <tbody> <tr> <td style="border: none;">$1 \times C \equiv C \quad 1 \times 838 = 838 \text{ kJ}$</td> <td style="border: none;">$1 \times C-C \quad 1 \times -348 = 348 \text{ kJ}$</td> </tr> <tr> <td style="border: none;">$2 \times C-H \quad 2 \times 412 = 824 \text{ kJ}$</td> <td style="border: none;">$6 \times C-H \quad 6 \times -412 = 2472 \text{ kJ}$</td> </tr> <tr> <td style="border: none;">$2 \times H-H \quad 2 \times 436 = 872 \text{ kJ}$</td> <td style="border: none;"></td> </tr> <tr> <td style="border: none; text-align: center;"><u>$= 2534 \text{ kJ}$</u></td> <td style="border: none; text-align: center;"><u>$= 2820 \text{ kJ}$</u></td> </tr> <tr> <td colspan="2" style="border: none; text-align: center;">$\Delta H^\circ = +2534 - 2820 = -286 \text{ kJ mol}^{-1}$</td> </tr> </tbody> </table>	Bond Breaking Steps	Bond Forming Steps	$1 \times C \equiv C \quad 1 \times 838 = 838 \text{ kJ}$	$1 \times C-C \quad 1 \times -348 = 348 \text{ kJ}$	$2 \times C-H \quad 2 \times 412 = 824 \text{ kJ}$	$6 \times C-H \quad 6 \times -412 = 2472 \text{ kJ}$	$2 \times H-H \quad 2 \times 436 = 872 \text{ kJ}$		<u>$= 2534 \text{ kJ}$</u>	<u>$= 2820 \text{ kJ}$</u>	$\Delta H^\circ = +2534 - 2820 = -286 \text{ kJ mol}^{-1}$	
Bond Breaking Steps	Bond Forming Steps													
$1 \times C \equiv C \quad 1 \times 838 = 838 \text{ kJ}$	$1 \times C-C \quad 1 \times -348 = 348 \text{ kJ}$													
$2 \times C-H \quad 2 \times 412 = 824 \text{ kJ}$	$6 \times C-H \quad 6 \times -412 = 2472 \text{ kJ}$													
$2 \times H-H \quad 2 \times 436 = 872 \text{ kJ}$														
<u>$= 2534 \text{ kJ}$</u>	<u>$= 2820 \text{ kJ}$</u>													
$\Delta H^\circ = +2534 - 2820 = -286 \text{ kJ mol}^{-1}$														
2b	Bond enthalpies used are mean bond enthalpies and not measure directly	The bond enthalpies for $C \equiv C$, $C-H$ and $C-C$ are averages and not the measured values from the experimental route described.												
3a	+129	$\Delta H^\circ = \sum \Delta H^\circ(\text{products}) - \sum \Delta H^\circ(\text{reactants})$ $= (-1131) + (-394) + (-242) - (2 \times -948)$ $= -1767 - (-1896) = +129 \text{ kJ mol}^{-1}$												
3b	385.1K	The reaction becomes thermodynamically feasible when $\Delta G^\circ = \Delta H^\circ - T\Delta S^\circ = 0$ $\therefore T\Delta S^\circ = \Delta H^\circ \quad \therefore T = \frac{\Delta H^\circ}{\Delta S^\circ} = \frac{129 \times 1000 \text{ J mol}^{-1}}{335 \text{ J K}^{-1} \text{ mol}^{-1}} = 385.1 \text{ K}$												
3c	378-380K	When reaction becomes feasible, the product gases CO_2 and steam are produced. From the graph, gases are produced at 378-380K.												
3d	Any answer from:	<table style="width: 100%; border: none;"> <tr> <td style="border: none;">Oil bath heated too quickly</td> <td style="border: none;">S° valid at 25°C rather than room temperature</td> </tr> <tr> <td style="border: none;">Oil bath not stirred</td> <td style="border: none;">Not carried out at standard conditions</td> </tr> <tr> <td style="border: none;">Impure/wet sample</td> <td style="border: none;">Gas leaks</td> </tr> <tr> <td style="border: none;">Unequal distribution of temperature in the powder</td> <td style="border: none;">Sticky gas syringe</td> </tr> </table>	Oil bath heated too quickly	S° valid at 25°C rather than room temperature	Oil bath not stirred	Not carried out at standard conditions	Impure/wet sample	Gas leaks	Unequal distribution of temperature in the powder	Sticky gas syringe				
Oil bath heated too quickly	S° valid at 25°C rather than room temperature													
Oil bath not stirred	Not carried out at standard conditions													
Impure/wet sample	Gas leaks													
Unequal distribution of temperature in the powder	Sticky gas syringe													
4a	2-phenylpropane has more van der Waals attractions	More atoms in 2-phenylpropane than benzene so stronger van der Waals intermolecular attractions between 2-phenylpropane molecules.												
4b	Benzoic acid contains hydrogen bonding	The $-OH$ bond in the carboxyl group gives benzoic acid hydrogen bonding to raise the boiling point of benzoic acid.												
4c	Any 2-halopropane	2-fluoropropane, 2-chloropropane, 2-bromopropane or 2-iodopropane												
5a	$1s^2 2s^2 2p^6 3s^2 3p^6 3d^7$ or $[Ne] 3s^2 3p^6 3d^7$	Electron arrangement of Co atom: $1s^2 2s^2 2p^6 3s^2 3p^6 3d^7 4s^2$ 4s electrons are removed before 3d electrons on ionisation to Co^{2+} ion Electron arrangement of Co^{2+} ion: $1s^2 2s^2 2p^6 3s^2 3p^6 3d^7 4s^2$ NB $[Ar]3d^7$ is not acceptable answer as there are no s or p orbitals in answer.												
5b	Hexaamminecobalt(II) or hexaamminecobalt(II)	NH_3 ligands are called ammine not amine or amino Complex has overall positive charge so complex name does not end in -ate Co^{2+} ion has oxidation number = 2 so (II) after cobalt in name												
5c	Oxidising agent for oxidation of $Co^{2+} \rightarrow Co^{3+}$	<table style="width: 100%; border: none;"> <tr> <td style="width: 50%; border: none;">$K_4[Co(CN)_6]$</td> <td style="width: 50%; border: none;">$K_3[Co(CN)_6]$</td> </tr> <tr> <td style="border: none;">$4 \times K^+ \therefore$ complex must be $[Co(CN)_6]^{4-}$</td> <td style="border: none;">$3 \times K^+ \therefore$ complex must be $[Co(CN)_6]^{3-}$</td> </tr> <tr> <td style="border: none;">$6 \times CN^- \therefore$ Co ion must be Co^{2+} ion as $-6+2=-4$</td> <td style="border: none;">$6 \times CN^- \therefore$ Co ion must be Co^{3+} ion as $-6+3=-3$</td> </tr> <tr> <td style="border: none;">Oxidation Step: $Co^{2+} \rightarrow Co^{3+} + e^-$</td> <td style="border: none;">Reduction Step: $Cl_2 + 2e^- \rightarrow 2Cl^-$</td> </tr> </table>	$K_4[Co(CN)_6]$	$K_3[Co(CN)_6]$	$4 \times K^+ \therefore$ complex must be $[Co(CN)_6]^{4-}$	$3 \times K^+ \therefore$ complex must be $[Co(CN)_6]^{3-}$	$6 \times CN^- \therefore$ Co ion must be Co^{2+} ion as $-6+2=-4$	$6 \times CN^- \therefore$ Co ion must be Co^{3+} ion as $-6+3=-3$	Oxidation Step: $Co^{2+} \rightarrow Co^{3+} + e^-$	Reduction Step: $Cl_2 + 2e^- \rightarrow 2Cl^-$				
$K_4[Co(CN)_6]$	$K_3[Co(CN)_6]$													
$4 \times K^+ \therefore$ complex must be $[Co(CN)_6]^{4-}$	$3 \times K^+ \therefore$ complex must be $[Co(CN)_6]^{3-}$													
$6 \times CN^- \therefore$ Co ion must be Co^{2+} ion as $-6+2=-4$	$6 \times CN^- \therefore$ Co ion must be Co^{3+} ion as $-6+3=-3$													
Oxidation Step: $Co^{2+} \rightarrow Co^{3+} + e^-$	Reduction Step: $Cl_2 + 2e^- \rightarrow 2Cl^-$													

5d	d→d splitting different due to different ligand field strength	The degree of splitting of the d-orbitals is dependent on the field strength of the ligand available												
5e	217.7	$E = \frac{Lhc}{\lambda} = \frac{6.02 \times 10^{23} \text{ mol}^{-1} \times 6.63 \times 10^{-34} \text{ J s} \times 3 \times 10^8 \text{ m s}^{-1}}{550 \times 10^{-9} \text{ m}} = 217705 \text{ J mol}^{-1}$ $= 217.7 \text{ kJ mol}^{-1}$												
6a	$\text{MnO}_4^- + 8\text{H}^+ + 5\text{Fe}^{2+}$ \downarrow $\text{Mn}^{2+} + 4\text{H}_2\text{O} + 5\text{Fe}^{3+}$	$\textcircled{1} \quad \text{MnO}_4^- + 8\text{H}^+ + 5\text{e}^- \rightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O}$ $\textcircled{2} \times 5 \quad 5\text{Fe}^{2+} \rightarrow 5\text{Fe}^{3+} + 5\text{e}^-$ <p>Add $\textcircled{1} + \textcircled{2}'$ $\text{MnO}_4^- + 8\text{H}^+ + 5\text{Fe}^{2+} \rightarrow \text{Mn}^{2+} + 4\text{H}_2\text{O} + 5\text{Fe}^{3+}$</p>

9c	reduction	Oxidation: propan-2-ol \rightarrow propanone \therefore Reduction: propanone \rightarrow propan-2-ol
10a	Ethers	Ethers contain the group C-O-C and are also known as alkoxyalkanes
10b	Add sodium metal	Add a group 1 metal to methanol: $2\text{CH}_3\text{OH} + 2\text{Na} \rightarrow \text{H}_2 + 2\text{Na}^+\text{CH}_3\text{O}^-$
10c(i)	<p><u>Step 1</u> Heterolytic fission of C-Cl bond to form carbocation</p> <p><u>Step 2</u> Nucleophilic attack of methoxide ion</p>	
10c(ii)	Too many bulky methyl groups around C-Cl bond which provide steric hindrance	$\text{S}_{\text{N}}2$ reactions occur when a nucleophile attacks the δ^+ of the polar carbon-halogen(X) bond. In tertiary halogenalkanes, the bulky alkyl groups reduce the likelihood of a successful collision by the nucleophile. This makes the $\text{S}_{\text{N}}1$ reaction more likely via heterolytic fission of the C-X bond forming a carbocation intermediate.
