2013 Revised Adv H Chem Marking Scheme

Long Qu	Answer	Reasoning
1a	Equal in energy	Degenerate orbitals are equal in energy. The three 2p orbitals in the 2 nd shell are equal in energy and the electrons will fill them up singly in any order as they are equal in energy to each other.
1b		<p>According to the aufbau principle, electrons fill up in orbitals of lowest energy first ∴ 1s then 2s then 2p (then 3s then 3p then 4s then 3d ...)</p> <p>According to Hund's Rules, orbitals fill up single with parallel spins first.</p>
1c	sp ³ hybridisation	One s orbital and three p orbitals in the 2 nd shell of carbon atoms hybridise to form 4 sp ³ hybrid orbitals
2a	-220.3 J K ⁻¹ mol ⁻¹	$\begin{aligned} \Delta S^\circ &= \Sigma S^\circ_{(\text{products})} - \Sigma S^\circ_{(\text{reactants})} \\ &= (2 \times 27.0) + (1 \times 5.7) - ((2 \times 33.0) + (1 \times 214)) \\ &= 54.0 + 5.7 - (66.0 + 214) \\ &= 59.7 - 280 \\ &= -220.3 \text{ J K}^{-1} \text{ mol}^{-1} \end{aligned}$
2b	-526.4 kJ mol ⁻¹	<p> $\text{Mg(s)} + \frac{1}{2} \text{O}_2(\text{g}) \rightarrow \text{MgO(s)} \quad \Delta H = -493 \text{ kJ mol}^{-1}$ $\text{C(s)} + \text{O}_2(\text{g}) \rightarrow \text{CO}_2(\text{g}) \quad \Delta H = -394 \text{ kJ mol}^{-1}$ $2 \times \text{Mg(s)} + \text{O}_2(\text{g}) \rightarrow 2 \text{MgO(s)} \quad \Delta H = -986 \text{ kJ}$ $\text{CO}_2(\text{g}) \rightarrow \text{C(s)} + \text{O}_2(\text{g}) \quad \Delta H = +394 \text{ kJ}$ $2 \times \text{Mg(s)} + \text{CO}_2(\text{g}) \rightarrow 2 \text{MgO(s)} + \text{C(s)} \quad \Delta H = -592 \text{ kJ}$ </p> $\begin{aligned} \Delta G^\circ &= \Delta H^\circ - T \Delta S^\circ \\ &= (-592) - 298 \times \frac{-220.3}{1000} \\ &= (-592) - (-65.6) \\ &= -526.4 \text{ kJ mol}^{-1} \end{aligned}$
3	Open Question Answer to Include:	3 mark answer
		Demonstrates a good understanding of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.
		2 mark answer
		Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.
		1 mark answer
		Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.
4a	Answer to include:	A series of standard solutions of different known concentrations of potassium permanganate are made up and their absorbencies measured.
4b	Green or 500-560nm	The solutions appear purple as the green light is removed by atomic adsorption and the red and blue light is transmitted giving a purple colour.
4c	0.29%	<p>From graph: Absorbance = 0.26 ∴ [MnO₄⁻] = 1.3 × 10⁻⁴ mol l⁻¹</p> <p>no. of mol = volume × concentration = 0.1 litres × 1.3 × 10⁻⁴ mol l⁻¹ = 1.3 × 10⁻⁵ mol</p> <p>mass of Mn = no. of mol × gfm = 1.3 × 10⁻⁵ mol × 54.9 g mol⁻¹ = 7.137 × 10⁻⁴ g</p> $\% \text{Mn} = \frac{\text{mass of Mn}}{\text{mass of steel}} \times 100 = \frac{0.0007137 \text{ g}}{0.245 \text{ g}} \times 100 = 0.29\%$
4d	296 kJ mol ⁻¹	$E = \frac{L \times h \times c}{\lambda} = \frac{6.02 \times 10^{23} \text{ mol}^{-1} \times 6.63 \times 10^{-34} \text{ J s} \times 3 \times 10^8 \text{ m s}^{-1}}{405 \times 10^{-9} \text{ m}}$ $= 295848.9 \text{ J mol}^{-1}$ $= 296 \text{ kJ mol}^{-1}$
5a	4	Each dimethylglyoxime molecule has two nitrogen atoms within its structure that have lone pairs of electrons which are donated to the central Ni ²⁺ ion in the complex. This gives a co-ordination number of four between the two dimethylglyoxime molecules and the Ni ²⁺ ion.

5b	19.8%	$1 \text{ mol Ni}(\text{C}_4\text{H}_7\text{O}_2\text{N}_2)_2 = (1 \times 58.7) + (8 \times 12) + (14 \times 1) + (4 \times 16) + (4 \times 14) = 58.7 + 96 + 14 + 64 + 56 = 288.7 \text{g}$ $\text{Mass of Ni in red precipitate} = 0.942 \text{g} \times \frac{\text{mass of Ni}}{\text{mass of complex}} = 0.942 \text{g} \times \frac{58.7}{288.7} = 0.1915 \text{g}$ $\% \text{Ni in impure salt} = \frac{0.1915}{0.968} \times 100 = 19.8\%$

Peak 1	Peak 2	Peak 3														
The graph show absorbance in the blue/violet region of the visible spectrum with a large peak around 400-450nm region	The graph show absorbance in the red region of the visible spectrum with a large peak around 640-700 region	The graph show absorbance in the infra-red region of the visible spectrum with a large peak around 800-900nm region														
blue light is absorbed by complex	red light is absorbed by complex	no effect: outwith visible spectrum														
<p>Conclusion from Peak 1 and Peak 2: red and blue light are absorbed and remaining green light is transmitted</p>																
5d(ii)	NH ₃ splits d-orbitals more Shorter wavelength absorbed to supply more energy	NH ₃ has a more powerful ligand field splitting effect from the spectrochemical series than H ₂ O and splits the 3d orbitals in the Ni ²⁺ to a greater degree. The d → d transitions require more energy and the lower wavelength is absorbed to supply the greater energy to make the d → d transitions.														
5d(iii)	green/blue	<table border="1" style="width: 100%; text-align: center;"> <thead> <tr> <th>Colour</th> <th>Red</th> <th>Orange</th> <th>Yellow</th> <th>Green</th> <th>Blue</th> <th>Violet</th> </tr> </thead> <tbody> <tr> <td>Wavelength (nm)</td> <td>640-700</td> <td>600-640</td> <td>560-600</td> <td>480-560</td> <td>450-480</td> <td>400-450</td> </tr> </tbody> </table> <p>Major absorbance at 600nm ∴ orange wavelengths are absorbed ∴ green/blue wavelengths are transmitted</p>	Colour	Red	Orange	Yellow	Green	Blue	Violet	Wavelength (nm)	640-700	600-640	560-600	480-560	450-480	400-450
Colour	Red	Orange	Yellow	Green	Blue	Violet

7c	Phenylethanal 3 peaks due to three different proton environments	Aldehyde	Phenylethanal	2-methylbutanal	3-methylbutanal	
		Structure				
		Peak Chemical Shift (ppm)	Corresponding Structure	Description	Relative Height of Peak	No of Hydrogens in Group
		3.2	ArCH ₂ R	CH ₂ group with alkyl R group on one end and aromatic group on other	2	2 Hydrogens in -CH ₂ - group
6.7	ArH	Aromatic Group attached to hydrogen	5	5 hydrogens in -C ₆ H ₅ group		
9.2		Aldehyde group attached to alkyl group	1	1 hydrogen in -CHO group		
7d	Agonist	Agonists	fit the binding site and cause a biological response inside the cell			
		Antagonists	fit the binding site of the receptor but does not cause the biological response and prevents any other chemical doing so.			
8a(i)	1 or 1 st order	[C ₄ H ₉ Br] / mol l ⁻¹	[NaOH] / mol l ⁻¹	Initial Rate / mol l ⁻¹ s ⁻¹		
		8.0x10 ⁻⁴	0.10	0.15		
		1.6x10 ⁻³	0.10	0.30		
Doubling [C ₄ H ₉ Br] doubles the rate ∴ first order kinetics						
8a(ii)	Zero or no order	[C ₄ H ₉ Br] / mol l ⁻¹	[NaOH] / mol l ⁻¹	Initial Rate / mol l ⁻¹ s ⁻¹		
		1.6x10 ⁻³	0.10	0.15		
		1.6x10 ⁻³	0.20	0.30		
Doubling [NaOH] does not change the rate ∴ zero order kinetics						
8b	Rate=k[C ₄ H ₉ Br]	Rate = k[C ₄ H ₉ Br] ¹ [NaOH] ⁰ = k[C ₄ H ₉ Br]				
8c	187.5 s ⁻¹	rate = k[C ₄ H ₉ Br] ∴ k = $\frac{\text{rate}}{[\text{C}_4\text{H}_9\text{Br}]} = \frac{0.15 \text{ mol l}^{-1} \text{ s}^{-1}}{8 \times 10^{-4} \text{ mol l}^{-1}} = 187.5 \text{ s}^{-1}$				
8d	2-bromo-2-methylpropane (2-bromomethylpropane) Or tertiary structure Tertiary haloalkanes form more stable carbocation intermediates due to steric hindrance of the tertiary structure	1-bromobutane	2-bromobutane	1-bromo-2-methylpropane	2-bromo-2-methylpropane	
		primary haloalkane	secondary haloalkane	primary haloalkane	tertiary haloalkane	
		Primary and secondary haloalkanes react with NaOH by S _N 2 mechanism. 2 particles are involved in the rate determining step where the nucleophilic species (OH ⁻ ion) attacks the central carbon due to the lack of steric hindrance of primary/secondary structure.				Tertiary haloalkanes react by S _N 1 mechanism. Carbocations are formed first in the RDS and then the nucleophilic species (OH ⁻) attacks the planar carbocation intermediate to form alcohol
8e	Mechanism showing:					
		S _N 1 nucleophilic substitution will take place as only 2-bromo-2-methylpropane is involved in the Rate Determining Step (Step 1) as hydroxide ions are zero order.				

9a	One answer from:	fairly high molecular mass	available in high purity	(thermodynamically) stable	Soluble in water (or named solvent)	soluble	
9b	Answer to include:	Step 1	Accurately weigh required/correct mass of Na_2CO_3 and dissolve completely in small volume of deionised water				
		Step 2	Transfer the solution to a standard flask, sensing the beaker with deionised water and transferring risings to the flask				
		Step 3	Add deionised water up to the mark adding the last few drops with a dropper				
		Step 4	Invert to mix once stoppered.				
9c	Answer to include:	$\text{no. of mol} = \text{volume} \times \text{concentration} = 0.250 \text{ litres} \times 0.2 \text{ mol l}^{-1} = 0.05 \text{ mol}$ $\text{volume} = \frac{\text{no. of mol}}{\text{concentration}} = \frac{0.05 \text{ mol}}{1 \text{ mol l}^{-1}} = 0.05 \text{ litres} = 50 \text{ cm}^3 \text{ (1st mark)}$ 2 nd mark: Measure 50 cm^3 of stock $1 \text{ mol l}^{-1} \text{ Na}_2\text{CO}_3$ solution using a pipette and transfer to 250 cm^3 standard flask Add deionised water up to the mark, stopper and invert.					
10a	Electrophilic Substitution (or alkylation)	$\text{Cl}-\text{CH}_2\text{CH}_3 \xrightarrow[\text{(heterolytic fission)}]{\text{aluminium chloride AlCl}_3} \text{}^+\text{CH}_2\text{CH}_3 + \text{Cl}^-$					
10b	Chlorine molecule splits to form chlorine free radicals with one electron going to each chlorine	Light/uv radiation is required in the initiation step of a free radical chain reaction: $\text{Cl}_2 \xrightarrow{\text{u.v. light}} 2\text{Cl}\cdot$ by homolytic fission. 					
10c							
10d	Elimination	KOH(aq) is used for nucleophilic substitution of $-\text{OH}$ groups onto haloalkanes KOH dissolved in ethanol is used for elimination reactions forming alkenes from haloalkanes					
10e							
11a	Phosphoric acid <u>or</u> aluminium oxide <u>or</u> sulphuric acid	Phosphoric acid (sometimes referred to as orthophosphoric acid), hot aluminium oxide and concentrated sulphuric acid perform dehydration reactions, a type of elimination reaction.					
11b(i)	87.8%	$1 \text{ mol C}_6\text{H}_{11}\text{OH} = (6 \times 12) + (12 \times 1) + (1 \times 16) = 72 + 12 + 16 = 100 \text{ g}$ $1 \text{ mol C}_6\text{H}_{10} = (6 \times 12) + (10 \times 1) = 72 + 10 = 82 \text{ g}$ $\text{C}_6\text{H}_{11}\text{OH} \longrightarrow \text{C}_6\text{H}_{10} + \text{H}_2\text{O}$ $\begin{array}{ccc} 1 \text{ mol} & & 1 \text{ mol} \\ 100 \text{ g} & & 82 \text{ g} \\ 4.36 \text{ g} & & 82 \text{ g} \times 4.36 / 100 \\ & & = 3.5752 \text{ g (Theoretical)} \end{array}$ $\% \text{ Yield} = \frac{\text{Actual}}{\text{Theoretical}} \times 100 = \frac{3.14}{3.5752} \times 100 = 87.8\%$					

11b(ii)	One answer from:	Impure starting materials	Mechanical losses	Mass transfer losses	
		Reaction may not go to completion	Side reactions	Equilibrium reaction	
11c	Open Question Answer to Include:	3 mark answer	2 mark answer	1 mark answer	
		Demonstrates a good understanding of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.	
12a	C ₄ H ₁₀ O	Mass of carbon in CO ₂ = $\frac{12}{44} \times 11.89\text{g} = 3.243\text{g}$ Mass of hydrogen in H ₂ O = $\frac{2}{18} \times 6.08\text{g} = 0.676\text{g}$ Mass of oxygen = total mass - (mass of carbon + hydrogen) = 5.00 - 3.243 - 0.676 = 1.081g			
		Elements	C	H	O
		Mass or %	3.243g	0.676g	1.081g
		Divide by RAM	$\frac{3.243\text{g}}{12\text{g mol}^{-1}} = 0.270\text{ mol}$	$\frac{0.676\text{g}}{1\text{g mol}^{-1}} = 0.676\text{ mol}$	$\frac{1.081\text{g}}{16\text{g mol}^{-1}} = 0.0676\text{ mol}$
		Divide through by smallest number	$\frac{0.270\text{mol}}{0.0676\text{mol}} = 3.99$	$\frac{0.676\text{mol}}{0.0676\text{mol}} = 10$	$\frac{0.0676\text{mol}}{0.0676\text{mol}} = 1$
