4.282g		$172.1\text{g} \times \frac{4.282}{214.1}$																
		= 3.442g																
4d	Answer to include:	The sample is mixed with pure sulfanilamide. If melting point of the mixture will be the same as pure sulfanilamide if sample is pure.																
4e	One from:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;">Thin layer chromatography (TLC)</td> <td style="padding: 2px;">Infrared Spectroscopy</td> <td style="padding: 2px;">Proton NMR</td> </tr> </table>	Thin layer chromatography (TLC)	Infrared Spectroscopy	Proton NMR													
Thin layer chromatography (TLC)	Infrared Spectroscopy	Proton NMR																
5a	4 or IV	VO^{2+} : Vanadium oxide no. + (-2) = +2 \therefore vanadium oxide no. = +2 - (-2) = +4																
5b	Green colour from mixture of blue and yellow	During the reaction there will be a mixture of yellow VO_2^+ ions and blue VO^{2+} ions. For a short period the yellow and blue colours mix together																
5c	3	$V = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^3 4s^2 \therefore V^{2+} = 1s^2 2s^2 2p^6 3s^2 3p^6 3d^3$																
5d	Vanadium ions oxidised/ reacts with oxygen	When the stopper is removed, oxygen enters flask and reacts with vanadium ions to form blue VO^{2+} by an oxidation reaction (oxidation number increases 2 \rightarrow 4)																
6a(i)	0.36	$\text{N}_2\text{O}_4(\text{g}) \rightleftharpoons 2\text{NO}_2(\text{g})$ <table style="margin-left: auto; margin-right: auto; border: none;"> <tr> <td style="text-align: center;">1mol</td> <td style="text-align: center;">2mol</td> </tr> <tr> <td style="text-align: center;">0.12mol</td> <td style="text-align: center;">0.24mol</td> </tr> </table> $\therefore \text{no of mol of N}_2\text{O}_4 \text{ at equilibrium} = 0.28\text{mol} - 0.12\text{mol} = 0.16\text{mol}$ $K = \frac{[\text{NO}_2]^2}{[\text{N}_2\text{O}_4]} = \frac{(0.24)^2}{0.16} = \frac{0.0576}{0.16} = 0.36$	1mol	2mol	0.12mol	0.24mol												
1mol	2mol																	
0.12mol	0.24mol																	
6a(ii)	Forward reaction is endothermic as decreasing temperature favours reverse reaction	Decreasing temperature favours the reverse reaction. At 127°C, K=0.36 and at 25°C, K=0.12 \therefore as temperature decreases K decrease \therefore value of K decreases when [products] decreases and [reactants] increases \therefore reverse reaction is favoured																
6b(i)	$x = 7.40 \times 10^{-4}$ $y = 2.96 \times 10^{-3}$	From equation: rate = $k[\text{NO}]^2$ 2 nd order with respect to NO zero order with respect to H ₂ Compare ①+②: [H ₂]x2 but H ₂ is zero order \therefore no change of rate $\therefore x = 7.40 \times 10^{-4}$ Compare ②+③: [NO]x2 but NO is 2 nd order \therefore rate quadruples $\therefore y = 7.40 \times 10^{-4} \times 4 = 2.96 \times 10^{-3}$																
6b(ii)	$185 \text{ l mol}^{-1} \text{ s}^{-1}$	Rate = $k[\text{NO}]^2 \therefore k = \frac{\text{Rate}}{[\text{NO}]^2} = \frac{7.40 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}}{(2.00 \times 10^{-3} \text{ mol l}^{-1})^2} = \frac{7.40 \times 10^{-4} \text{ mol l}^{-1} \text{ s}^{-1}}{4.00 \times 10^{-6} \text{ mol}^2 \text{ l}^{-2}} = 185 \text{ l mol}^{-1} \text{ s}^{-1}$																

7	Open Question Answer to Include:	3 mark answer Demonstrates a good understanding of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	2 mark answer Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	1 mark answer Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.								
8a	sp^2	The carbon atoms in a benzene ring have sp^2 hybridisation and the electron in the 4 th unhybridised p-orbital becomes part of the delocalised ring of 6 π electrons										
8b(i)	CH_3Cl and $AlCl_3$	Combination from: <table border="1" data-bbox="770 488 1297 544"> <tr> <td>Reactant</td> <td>Chloromethane CH_3Cl</td> <td colspan="2">Bromomethane CH_3Br</td> </tr> <tr> <td>Catalyst</td> <td>$FeCl_3$</td> <td>$AlCl_3$</td> <td>$FeBr_3$ $AlBr_3$</td> </tr> </table>			Reactant	Chloromethane CH_3Cl	Bromomethane CH_3Br		Catalyst	$FeCl_3$	$AlCl_3$	$FeBr_3$ $AlBr_3$
Reactant	Chloromethane CH_3Cl	Bromomethane CH_3Br										
Catalyst	$FeCl_3$	$AlCl_3$	$FeBr_3$ $AlBr_3$									
8b(ii)	Electrophilic substitution	CH_3Cl heterolytically splits into CH_3^+ and Cl^- with $AlCl_3$ catalyst  <p style="text-align: center;">benzene methylbenzene</p>										
8c(i)		<p style="text-align: center;">-OH group is carbon number 1 in benzene ring -NO₂ nitro groups then placed on carbons 2, 4 and 6</p> 										
8c(ii)	NO_2^+	<p>Nitronium ion formed by: $HNO_3 + H_2SO_4 \rightarrow NO_2^+ + H_3O^+ + 2HSO_4^-$</p>  <p style="text-align: center;">benzene nitrobenzenonium intermediate ion nitrobenzene</p>										
9a	Alternating single and double bonds or conjugated system	A conjugated system is a section of a molecule with alternating single and double bonds between carbon atoms. The system of Pi bonds can absorb light in the visible region leaving the remaining wavelengths as the colour viewed from outside.										
9b	Red and green wavelengths are absorbed but blue wavelengths are transmitted	The colour of a substance corresponds to the colour wavelengths that are not absorbed by the substance. For a substance to be blue in colour the red and green wavelengths are absorbed by the substance and the remaining wavelengths (in this case blue) are transmitted to give the blue colour.										
9c	Diagram showing:											

9d	$C_{10}H_{11}NO_4$													
9e	Addition	Propanone CH_3COCH_3 adds across $C=O$ carbonyl group of 2-nitrobenzaldehyde with $-H$ joining to the O of the $C=O$ group and $-CH_2COCH_3$ adding to the C side of the $C=O$ group.												
10a	2-chloro-2-methylpropane or 2-chloromethylpropane	<p>$(CH_3)_3CCl$ has the full structural formula:</p>												
10b	Both structures:	<p style="text-align: center;">$CH_2=CHCH_2CH_3$ (but-1-ene) $CH_3CH=CHCH_3$ (but-2-ene)</p>

10f	A must be racemic B is no chiral carbon	A has a chiral carbon with four different groups attached. For isomer A to be optically inactive then the sample must have equal quantities of each optical isomer (called a racemic mixture). Isomer B is optically inactive as it lacks a chiral carbon with 4 different groups attached.												
11a(i)	Answer to include:	Lone pair of electrons on the N atom/amine group of reactant B donates electrons to Reactant A so Reactant B is a nucleophile.												
11a(ii)	3570-3200	The product has a hydroxyl group on the six carbon ring than neither reactant A or B has. Alcohols and phenols contain an $-OH$ group and have an absorbance peak between $3570-3200\text{ cm}^{-1}$.												
11b	Open Question Answer to Include:	<table border="1"> <thead> <tr> <th>3 mark answer</th> <th>2 mark answer</th> <th>1 mark answer</th> </tr> </thead> <tbody> <tr> <td>Demonstrates a good understanding of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.						
3 mark answer	2 mark answer	1 mark answer												
Demonstrates a good understanding of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.												

12a	C_2H_6S	Mass of carbon in $CO_2 = \frac{12}{44} \times 3.52g = 0.96g$ Mass of hydrogen in $H_2O = \frac{2}{18} \times 2.16g = 0.24g$ Mass of sulphur in $SO_2 = \frac{32.1}{64.1} \times 2.56g = 1.28g$			
		Elements	C	H	S
		Mass or %	0.96g	0.24g	1.28g
		Divide by RAM	$\frac{0.96g}{12g\ mol^{-1}}$ = 0.08mol	$\frac{0.24g}{1g\ mol^{-1}}$ = 0.24mol	$\frac{1.28g}{32.1g\ mol^{-1}}$ = 0.04mol
		Divide through by smallest number	$\frac{0.08mol}{0.04mol}$ = 2	$\frac{0.24mol}{0.04mol}$ = 6	$\frac{0.04mol}{0.04mol}$ = 1
Empirical Formula	2	6	1		
12b	$\left[\begin{array}{c} H \\ \\ H-C-S \\ \\ H \end{array} \right]^+$ or $\left[\begin{array}{c} H \\ \\ C-S-H \\ \\ H \end{array} \right]^+$	Peak at $m/z = 47 \therefore$ fragment has mass of 47amu As S atom has mass or 32, remaining fragment has mass of 15 \therefore remaining fragment is CH_3 with mass of 15			
12c	$\begin{array}{c} H\ H \\ \ \\ H-C-C-S-H \\ \ \\ H\ H \end{array}$	Peak	1	2	3
		Chemical Shift/ppm	1.2	1.5	2.4
		Structure	CH_3		CH_2
		Relative Area under peak	97	32	65
		No of Hydrogen in group	3	1	2
