28	C	81	<input checked="" type="checkbox"/> A $\text{C}_3\text{H}_8$ has no C=C double bond for an addition reaction to take place in Reaction 1 <input checked="" type="checkbox"/> B $\text{C}_3\text{H}_8$ has no C=C double bond for an addition reaction to take place in Reaction 1 <input checked="" type="checkbox"/> C reaction 1 is a free radical substitution reaction, reaction 2 is a nucleophilic substitution reaction and reaction 3 is an elimination reaction <input checked="" type="checkbox"/> D $\text{C}_3\text{H}_7\text{Br}$ has no C=C double bond for an addition reaction to take place in Reaction 2										
29	A	68	<input checked="" type="checkbox"/> A KOH in ethanol is an elimination reaction where HBr is eliminated from $\text{C}_3\text{H}_7\text{Br}$ <input checked="" type="checkbox"/> B $\text{CN}^-$ ions swaps with Br in a nucleophilic substitution reaction <input checked="" type="checkbox"/> C $\text{C}_2\text{H}_5\text{O}^-$ ions swaps with Cl in a nucleophilic substitution reaction <input checked="" type="checkbox"/> D $\text{OH}^-$ ions swaps with Br in a nucleophilic substitution reaction										
30	A	62	<input checked="" type="checkbox"/> A both ethene and $\text{Br}^-$ are attracted to positive charge $\therefore$ both acting as nucleophiles <input checked="" type="checkbox"/> B $\text{Br}^-$ is attracted to $\delta+$ on cyclic intermediate $\therefore$ $\text{Br}^-$ is acting as a nucleophile <input checked="" type="checkbox"/> C ethene is attracted to $\delta+$ on Br-Br $\therefore$ ethene is acting as a nucleophile <input checked="" type="checkbox"/> D ethene is attracted to $\delta+$ on Br-Br $\therefore$ ethene is acting as a nucleophile										
31	A	77	<input checked="" type="checkbox"/> A increase in number of -OH groups increases both boiling point and viscosity due to H bonds <input checked="" type="checkbox"/> B increase in number of -OH groups $\therefore$ more hydrogen bonding $\therefore$ increasing in viscosity <input checked="" type="checkbox"/> C increase in number of -OH groups $\therefore$ more hydrogen bonding $\therefore$ increasing in boiling point <input checked="" type="checkbox"/> D increase in number of -OH groups $\therefore$ more hydrogen bonding $\therefore$ increasing in boiling point										
32	D	40	<input checked="" type="checkbox"/> A halogenalkane would convert into alcohol and then into an aldehyde/carboxylic acid <input checked="" type="checkbox"/> B halogenalkane would convert into alkanenitrile and then into a carboxylic acid <input checked="" type="checkbox"/> C halogenalkane would eliminate a hydrogen halide molecule into an alkene <input checked="" type="checkbox"/> D halogenalkane reacts with $\text{C}_2\text{H}_5\text{O}^-$ ions to form an ether by nucleophilic substitution										
33	B	70	<input checked="" type="checkbox"/> A propanal oxidises to propanoic acid but propanal cannot react to form an ester <input checked="" type="checkbox"/> B propan-1-ol oxidises to propanoic acid and they react together to form an ester <input checked="" type="checkbox"/> C propan-2-ol oxidises to propanone. Propanone cannot react to form an ester <input checked="" type="checkbox"/> D propanoic acid does not oxidise										
34	A	60	<input checked="" type="checkbox"/> A aldehydes form a solid derivative with 2,4-dinitrophenylhydrazine <input checked="" type="checkbox"/> B carboxylic acids do not form derivatives with 2,4-dinitrophenylhydrazine <input checked="" type="checkbox"/> C esters do not form derivatives with 2,4-dinitrophenylhydrazine <input checked="" type="checkbox"/> D amides do not form derivatives with 2,4-dinitrophenylhydrazine										
35	B	76	<input checked="" type="checkbox"/> A boiling point analysis would be harder to achieve compared to melting point analysis <input checked="" type="checkbox"/> B a sharp melting point is essential for melting point analysis of a substance <input checked="" type="checkbox"/> C the derivative must not decompose if it is to be identified by melting point <input checked="" type="checkbox"/> D a low relative molecular mass is not essential for melting point analysis										

36	D	61	<input checked="" type="checkbox"/> A $C_6H_5OH$ will react with bases but not acids <input checked="" type="checkbox"/> B $C_6H_5NH_2$ will react with acids but not bases <input checked="" type="checkbox"/> C $HOC_6H_4COOH$ will react with bases but not acids <input checked="" type="checkbox"/> D $H_2NC_6H_4COOH$ will react with both acids and bases
37	B	89	<input checked="" type="checkbox"/> A Carbon only has 3 different groups attached to the central carbon <input checked="" type="checkbox"/> B Carbon only has 4 different groups attached to the central carbon <input checked="" type="checkbox"/> C Carbon only has 3 different groups attached to the central carbon <input checked="" type="checkbox"/> D Carbon only has 3 different groups attached to the central carbon
38	C	71	<input checked="" type="checkbox"/> A Carbon atoms are relatively small but show up in X-ray crystallography <input checked="" type="checkbox"/> B Hydrogen atoms are so small they barely register in X-ray crystallography <input checked="" type="checkbox"/> C Large atoms like iodine are easiest to locate in X-ray crystallography <input checked="" type="checkbox"/> D Oxygen atoms are relatively small but show up in X-ray crystallography
39	C	93	<input checked="" type="checkbox"/> A agonist: molecule which binds to receptor binding site and cause a biological response <input checked="" type="checkbox"/> B receptor: binding site for molecules with same pharmacophore shape <input checked="" type="checkbox"/> C antagonist: molecule which binds to binding site and does not cause a biological response <input checked="" type="checkbox"/> D pharmacophore: particular shape which fits the binding site of receptor exactly
40	C	45	<input checked="" type="checkbox"/> A $-O-CH_3$ is polar covalent but not ionic $\therefore$ no ionic interaction <input checked="" type="checkbox"/> B no H atom attached to O atom to be a hydrogen-bond donor <input checked="" type="checkbox"/> C O atom has lone pair of electrons to be a hydrogen-bond acceptor <input checked="" type="checkbox"/> D no H atom attached to O atom to be a hydrogen-bond donor

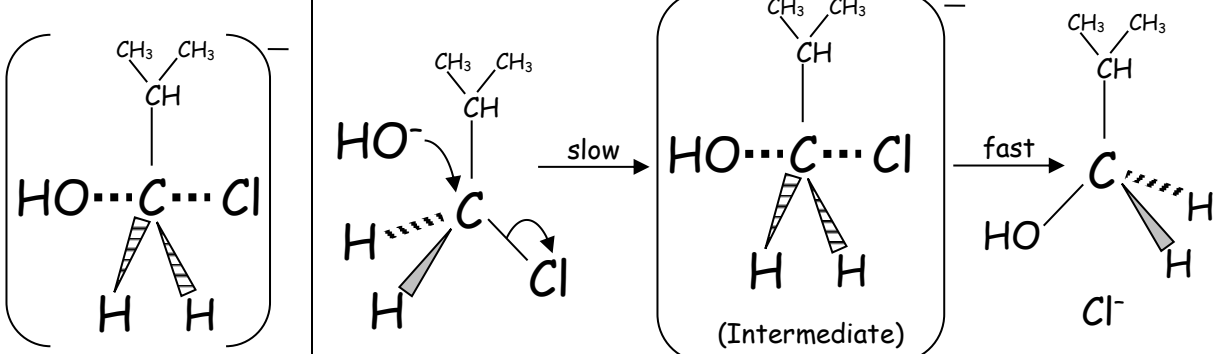

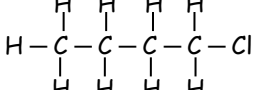

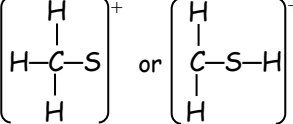

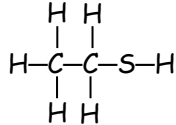

# 2015 Adv Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning
1a(i)	Equal/same energy	Degenerate means the orbitals are of equal energy.
1a(ii)	Any correct statement of Hund's Rules	Each orbital should be filled singly before a second electron fills each orbital.
1b(i)	239nm or $2.39 \times 10^{-7} \text{m}$	$E = \frac{L \times h \times c}{\lambda} \therefore \lambda = \frac{L \times h \times c}{E} = \frac{6.02 \times 10^{23} \text{mol}^{-1} \times 6.63 \times 10^{-34} \text{J s} \times 3 \times 10^8 \text{m s}^{-1}}{502 \times 1000 \text{J mol}^{-1}}$ $= 2.39 \times 10^{-7} \text{m}$ $= 239 \text{nm}$
1b(ii)	No, wavelength of visible too short	Visible light is between the wavelength of 450nm (violet end) and 700nm (red end). The wavelength 239nm is in the UV band of the electromagnetic spectrum.
2a	194 kJ mol <sup>-1</sup>	$\Delta H^\circ = \Sigma \Delta H_f^\circ(\text{products}) - \Sigma \Delta H_f^\circ(\text{reactants})$ $= (1 \times 130) + (1 \times -394) - (1 \times -348) + (1 \times -110)$ $= +130 - 394 - (-348 - 110)$ $= -264 - (-458)$ $= +194 \text{kJ mol}^{-1}$

9a	Red and green wavelengths are absorbed but blue wavelengths are transmitted	The colour of a substance corresponds to the colour wavelengths that are not absorbed by the substance. For a substance to be blue in colour, the red and green wavelengths are absorbed by the substance and the remaining wavelengths (in this case blue) are transmitted to give the blue colour.												
9b	Diagram showing:
