# 2023 Higher Chemistry Marking Scheme

MC Qu	Answer	Reasoning
1	A	<input checked="" type="checkbox"/> A Electronegativities Na = 0.9 & I = 2.7 ∴ difference = 1.8 (least ionic character) <input checked="" type="checkbox"/> B Electronegativities Na = 0.9 & F = 4.0 ∴ difference = 3.1 <input checked="" type="checkbox"/> C Electronegativities K = 0.8 & I = 2.7 ∴ difference = 1.9 <input checked="" type="checkbox"/> D Electronegativities K = 0.8 & F = 4.0 ∴ difference = 3.2 (greatest ionic character)
2	D	<input checked="" type="checkbox"/> A N-H bond in structure ∴ hydrogen bonding would occur between molecules <input checked="" type="checkbox"/> B O-H bond in structure ∴ hydrogen bonding would occur between molecules <input checked="" type="checkbox"/> C N-H bond in structure ∴ hydrogen bonding would occur between molecules <input checked="" type="checkbox"/> D No N-H, O-H or H-F bonds in structure ∴ no hydrogen bonding between molecules
3	C	
4	A	<input checked="" type="checkbox"/> A Activation of reverse reaction = 200 - 50 = +150kJ mol <sup>-1</sup> <input checked="" type="checkbox"/> B Enthalpy change for reverse reaction = 50 - 150 = -100kJ mol <sup>-1</sup> <input checked="" type="checkbox"/> C Activation of forward reaction = 200 - 150 = 150kJ mol <sup>-1</sup> <input checked="" type="checkbox"/> D Enthalpy change for forward reaction = 150 - 50 = +100kJ mol <sup>-1</sup>
5	C	$\text{time} = 10\text{s} \quad \therefore \text{rate} = \frac{1}{\text{time}} = \frac{1}{10\text{s}} = 0.1\text{ s}^{-1}$ <p>Extrapolate from graph: when rate = 0.1s<sup>-1</sup> then concentration = 0.25 mol l<sup>-1</sup></p>
6	B	<input checked="" type="checkbox"/> A catalyst speeds up reaction so dotted line would be steeper initially <input checked="" type="checkbox"/> B dotted line is steeper at start and meets full line at horizontal end of line <input checked="" type="checkbox"/> C catalyst does not change final concentrations so dotted line would meet full line at end <input checked="" type="checkbox"/> D catalyst speeds up reaction so dotted line would be steeper initially
7	B	$1 \text{ mol CH}_3\text{OH} = -726 \text{ kJ mol}^{-1} = 32\text{g}$ $-145.2 \text{ kJ mol}^{-1} = 32\text{g} \times \frac{-145.2}{-726}$ $= 6.4\text{g}$
8	A	<input checked="" type="checkbox"/> A Sodium Na atom (covalent radius = 160pm) is larger than sodium Na <sup>+</sup> ion (ionic radius = 102pm) <input checked="" type="checkbox"/> B Chloride Cl <sup>-</sup> ion (ionic radius = 181pm) is larger than chlorine Cl atom (covalent radius = 100pm) <input checked="" type="checkbox"/> C Magnesium Mg <sup>2+</sup> ion (ionic radius = 72pm) is smaller than magnesium Mg atom (covalent radius = 140pm) <input checked="" type="checkbox"/> D Oxygen O atom (covalent radius = 64pm) is smaller than oxide O <sup>2-</sup> ion (ionic radius = 140pm)
9	C	<input checked="" type="checkbox"/> A Covalent molecular is found in both elements e.g. O <sub>2</sub> and compounds e.g. H <sub>2</sub> O <input checked="" type="checkbox"/> B Covalent network is found in both elements e.g. C (diamond) and compounds e.g. SiO <sub>2</sub> <input checked="" type="checkbox"/> C Monoatomic structures are only found in elements <input checked="" type="checkbox"/> D Ionic structures are only found in compounds containing metals and non-metal elements
10	B	<input checked="" type="checkbox"/> A 2-methylbutanal C <sub>5</sub> H <sub>10</sub> O is <u>not</u> an isomer of hexanal C <sub>6</sub> H <sub>12</sub> O <input checked="" type="checkbox"/> B 3-methylpentan-2-one C <sub>6</sub> H <sub>12</sub> O is an isomer of hexanal C <sub>6</sub> H <sub>12</sub> O (same formula different structure) <input checked="" type="checkbox"/> C 2,2-dimethylbutan-1-ol C <sub>6</sub> H <sub>14</sub> O is <u>not</u> an isomer of hexanal C <sub>6</sub> H <sub>12</sub> O <input checked="" type="checkbox"/> D 3,3-dimethylpentanal C <sub>7</sub> H <sub>14</sub> O is <u>not</u> an isomer of hexanal C <sub>6</sub> H <sub>12</sub> O

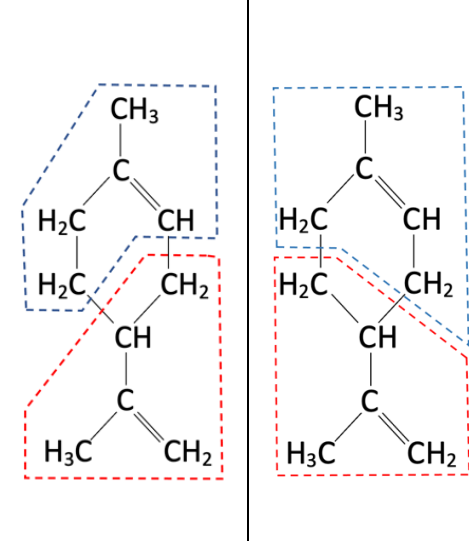

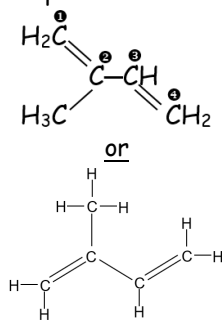

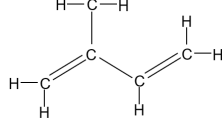

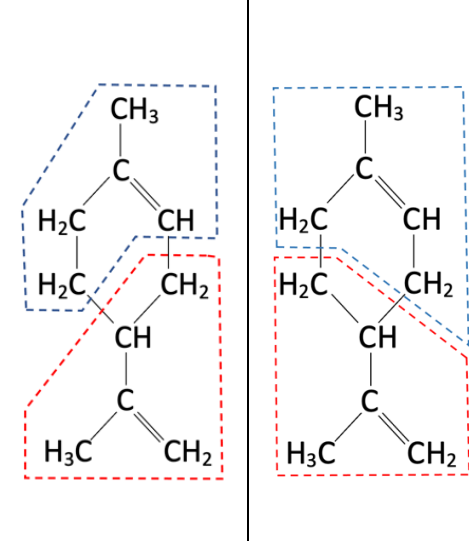

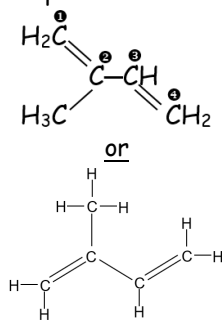

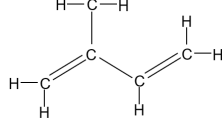

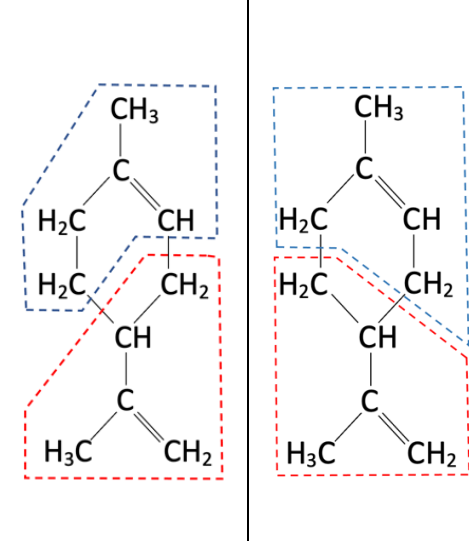

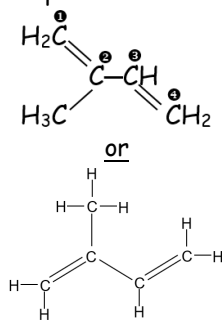

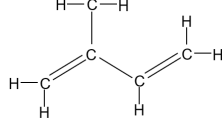

11	C	$  \begin{array}{c}  \text{O} \\     \\  -\text{C}-\text{OH} \\  \text{carboxyl group}  \end{array}  +  \begin{array}{c}  \text{H} \\    \\  \text{H}-\text{N}- \\  \text{amine}  \end{array}  \xrightarrow[\text{at join}]{\text{condensation}}  \begin{array}{c}  \text{O} \quad \text{H} \\     \quad   \\  -\text{C}-\text{N}- \\  \text{peptide link}  \end{array}  $ <p style="text-align: center;">(Note: In the original image, a dashed red box highlights the OH of the carboxyl group and the H of the amine group.)</p>
12	D	<input checked="" type="checkbox"/> A Formation of carbon monoxide indicated incomplete combustion not complete combustion <input checked="" type="checkbox"/> B Formation of carbon monoxide indicated incomplete combustion not complete combustion <input checked="" type="checkbox"/> C enthalpy of combustion is the complete combustion of <b>1 mole</b> of a substance <input checked="" type="checkbox"/> D The energy change for the complete combustion of 1 mol of a substance
13	D	<input checked="" type="checkbox"/> A ethyl ethanoate and water in B will react to form ethanol and ethanoic acid and form an equilibrium <input checked="" type="checkbox"/> B ethyl ethanoate and water in B will react to form ethanol and ethanoic acid and form an equilibrium <input checked="" type="checkbox"/> C ethanol and ethanoic acid react to form ethyl ethanoate and water in A and form an equilibrium <input checked="" type="checkbox"/> D ethyl ethanoate and water in B will react to form ethanol and ethanoic acid and form an equilibrium <input checked="" type="checkbox"/> D Flask A is the reactants at 100% and Flask B is the products at 100%. They will reach the same equilibrium eventually with ethyl ethanoate, water, ethanol and ethanoic acid present in both flasks at the same concentrations.
14	C	<p>Write Down main species <math>\text{IO}_3^- \longrightarrow \text{I}_2</math></p> <p>Balance all atoms other than oxygen and hydrogen <math>2\text{IO}_3^- \longrightarrow \text{I}_2</math></p> <p>Balance O by adding <math>\text{H}_2\text{O}</math> to other side <math>2\text{IO}_3^- \longrightarrow \text{I}_2 + 6\text{H}_2\text{O}</math></p> <p>Balance H by adding <math>\text{H}^+</math> ions to other side <math>2\text{IO}_3^- + 12\text{H}^+ \longrightarrow \text{I}_2 + 6\text{H}_2\text{O}</math></p> <p>Balance charge by adding <math>e^-</math> to most positive side <math>2\text{IO}_3^- + 12\text{H}^+ + 10e^- \longrightarrow \text{I}_2 + 6\text{H}_2\text{O}</math></p>
15	D	<input checked="" type="checkbox"/> A Condensation: 2 molecules join together with small molecule e.g. water removed at join <input checked="" type="checkbox"/> B Hydration: Addition reaction where $\text{H}_2\text{O}$ is added across a $\text{C}=\text{C}$ double bond <input checked="" type="checkbox"/> C Reduction: decrease in oxygen : hydrogen ratio <input checked="" type="checkbox"/> D Oxidation: increase in oxygen : hydrogen ratio ( $\text{C}_6\text{H}_7\text{ON} \rightarrow \text{C}_6\text{H}_5\text{O}_2\text{N}$ ) O:H ratio 1:7 $\rightarrow$ 2:5
16	B	<input checked="" type="checkbox"/> A 3x -OH group makes A the 2 <sup>nd</sup> most polar molecule and A is the 3 <sup>rd</sup> peak left to right <input checked="" type="checkbox"/> B no -OH groups makes B the least polar molecule and B is the 1 <sup>st</sup> peak left to right (Z) <input checked="" type="checkbox"/> C 2x -OH group makes C the 3 <sup>rd</sup> most polar molecule and C is the 2 <sup>nd</sup> peak left to right <input checked="" type="checkbox"/> D 6x -OH group makes D the most polar molecule and D is the 4 <sup>th</sup> peak left to right
17	C	<input checked="" type="checkbox"/> A Draft shield would reduce heat loss to the surroundings <input checked="" type="checkbox"/> B the thermometer in the diagram is too close to the flame and might give inaccurate temp <input checked="" type="checkbox"/> C glass beaker would reduce the heat transfer to the water compared to a copper can <input checked="" type="checkbox"/> D Stirring the water would mix the water better and give a more accurate temp
18	B	<input checked="" type="checkbox"/> A head of soap is ionic and therefore polar <input checked="" type="checkbox"/> B ionic head dissolves in polar water and non-polar tail dissolves in non-polar oil <input checked="" type="checkbox"/> C head of soap is ionic and therefore polar <input checked="" type="checkbox"/> D ionic head is polar and dissolves in polar water rather than non-polar head
19	C	<input checked="" type="checkbox"/> A unreacted nickel oxide must be removed by filtration before evaporation takes place <input checked="" type="checkbox"/> B the filtration of nickel oxide must be followed by evaporation of water to form salt <input checked="" type="checkbox"/> C the unreacted nickel oxide is filtered to remove it and the evaporation that follows removes the water from the nickel sulfate solution to leave nickel sulphate salt <input checked="" type="checkbox"/> D the unreacted nickel oxide must be filtered before evaporation takes place
20	B	<input checked="" type="checkbox"/> A ethanal $\text{CH}_3\text{CHO}$ is an aldehyde and does not react with alkalis <input checked="" type="checkbox"/> B ethanoic acid $\text{CH}_3\text{COOH}$ is a carboxylic acid and is neutralised by alkalis. <input checked="" type="checkbox"/> C propanone $\text{CH}_3\text{COCH}_3$ is a ketone and does not react with alkalis <input checked="" type="checkbox"/> D ethan-1-ol $\text{CH}_3\text{CH}_2\text{OH}$ is a primary alcohol and does not react with alkalis

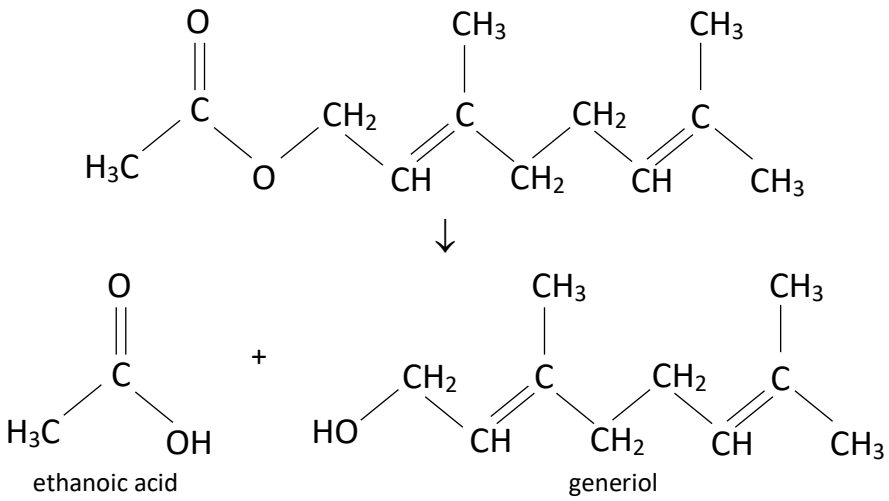

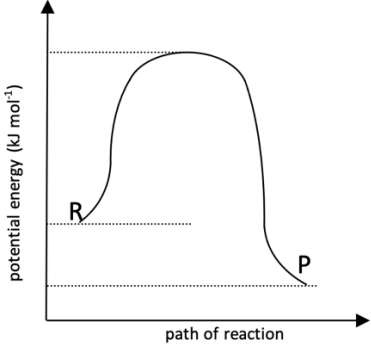

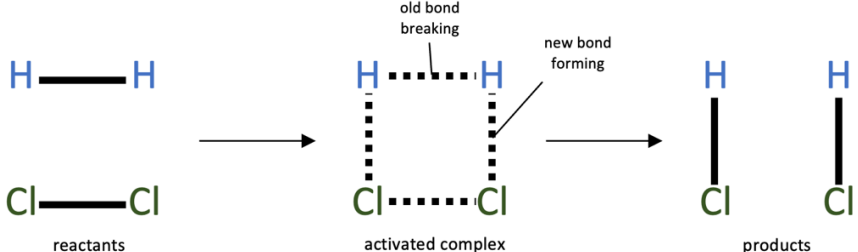

21	D	<input checked="" type="checkbox"/> A Secondary alcohol: 2 carbons directly attached to the carbon with -OH group <input checked="" type="checkbox"/> B Secondary alcohol: 2 carbons directly attached to the carbon with -OH group <input checked="" type="checkbox"/> C Tertiary alcohol: 3 carbons directly attached to the carbon with -OH group <input checked="" type="checkbox"/> D Primary alcohol: 1 carbon directly attached to the carbon with -OH group						
22	A	4-methylpentan-2-one is a ketone which reduces to form the secondary alcohol 4-methylpentan-2-ol. gfm 4-methylpentan-2-one $C_6H_{12}O = (6 \times 12) + (12 \times 1) + (1 \times 16) = 72 + 12 + 16 = 100g$ gfm 4-methylpentan-2-ol $C_6H_{14}O = (6 \times 12) + (14 \times 1) + (1 \times 16) = 72 + 14 + 16 = 102g$ <div style="text-align: center;"> <math display="block">  \begin{array}{ccc}  \text{4-methylpentan-2-one} &amp; \longrightarrow &amp; \text{4-methylpentan-2-ol} \\  C_6H_{12}O &amp; &amp; C_6H_{14}O \\  1\text{mol} &amp; &amp; 1\text{mol} \\  100g &amp; &amp; 102g  \end{array}  </math> </div>						
23	D	gfm $O_2 = 32g \therefore \text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{16}{32} = 0.5\text{mol}$ (same no. of mol = same volume) <input checked="" type="checkbox"/> A gfm $CO = 28g \therefore \text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{21}{28} = 0.75\text{mol}$ <input checked="" type="checkbox"/> B gfm $CO_2 = 44g \therefore \text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{44}{44} = 1.0\text{mol}$ <input checked="" type="checkbox"/> C gfm $NO_2 = 46g \therefore \text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{46}{46} = 1.0\text{mol}$ <input checked="" type="checkbox"/> D gfm $N_2O_4 = 92g \therefore \text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{46}{92} = 0.5\text{mol}$						
24	A	Ionic formula aluminium sulfate = $(Al^{3+})_2(SO_4^{2-})_3$ 1 mol of $Al_2(SO_4)_3$ contains 2 mol of positive $Al^{3+}$ ions 0.25mol <span style="margin-left: 150px;">0.5 mol</span>						
25	B	<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 50%; padding: 5px;"> <math>C_2</math> in <math>C=C</math> double bond has                no hydrogens directly attached to it  <math>\therefore Cl</math> of <math>H-Cl</math> attaches to <math>C_2</math> (major product)             </th> <th style="width: 50%; padding: 5px;"> <math>C_3</math> in <math>C=C</math> double bond has                1 hydrogen directly attached to it  <math>\therefore H</math> of <math>H-Cl</math> attaches to <math>C_3</math> (major product)             </th> </tr> </thead> <tbody> <tr> <td style="text-align: center; padding: 10px;"> <math display="block">  \begin{array}{ccccccc}  &amp; H &amp; CH_3 &amp; &amp; H &amp; H &amp; \\  &amp;   &amp;   &amp; &amp;   &amp;   &amp; \\  H &amp; - C^1 &amp; - C^2 = &amp; C^3 - &amp; C^4 - &amp; C^5 - &amp; H \\  &amp;   &amp; &amp;   &amp;   &amp;   &amp; \\  &amp; H &amp; &amp; H &amp; H &amp; H &amp;   \end{array}  </math> </td> <td style="text-align: center; padding: 10px;"> <math display="block">  \begin{array}{ccccccc}  &amp; H &amp; CH_3 &amp; H &amp; H &amp; H &amp; \\  &amp;   &amp;   &amp;   &amp;   &amp;   &amp; \\  H &amp; - C &amp; - C &amp; - C &amp; - C &amp; - C &amp; - H \\  &amp;   &amp;   &amp;   &amp;   &amp;   &amp; \\  &amp; H &amp; Cl &amp; H &amp; H &amp; H &amp;   \end{array}  </math> </td> </tr> <tr> <td style="text-align: center; padding: 10px;"> <math>+ \quad Cl - H</math> </td> <td></td> </tr> </tbody> </table>	$C_2$ in $C=C$ double bond has no hydrogens directly attached to it $\therefore Cl$ of $H-Cl$ attaches to $C_2$ (major product)	$C_3$ in $C=C$ double bond has 1 hydrogen directly attached to it $\therefore H$ of $H-Cl$ attaches to $C_3$ (major product)	$  \begin{array}{ccccccc}  & H & CH_3 & & H & H & \\  &   &   & &   &   & \\  H & - C^1 & - C^2 = & C^3 - & C^4 - & C^5 - & H \\  &   & &   &   &   & \\  & H & & H & H & H &   \end{array}  $	$  \begin{array}{ccccccc}  & H & CH_3 & H & H & H & \\  &   &   &   &   &   & \\  H & - C & - C & - C & - C & - C & - H \\  &   &   &   &   &   & \\  & H & Cl & H & H & H &   \end{array}  $	$+ \quad Cl - H$	
$C_2$ in $C=C$ double bond has no hydrogens directly attached to it $\therefore Cl$ of $H-Cl$ attaches to $C_2$ (major product)	$C_3$ in $C=C$ double bond has 1 hydrogen directly attached to it $\therefore H$ of $H-Cl$ attaches to $C_3$ (major product)							
$  \begin{array}{ccccccc}  & H & CH_3 & & H & H & \\  &   &   & &   &   & \\  H & - C^1 & - C^2 = & C^3 - & C^4 - & C^5 - & H \\  &   & &   &   &   & \\  & H & & H & H & H &   \end{array}  $	$  \begin{array}{ccccccc}  & H & CH_3 & H & H & H & \\  &   &   &   &   &   & \\  H & - C & - C & - C & - C & - C & - H \\  &   &   &   &   &   & \\  & H & Cl & H & H & H &   \end{array}  $							
$+ \quad Cl - H$								

# 2023 Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning																
1a(i)	Greater no. of protons/ nuclear charge holds electrons more tightly	Across a period, the same electron shell is filling up but there is a greater nuclear charge due to the increase atomic number. The outer shell is held more tightly by the nucleus and an electron is harder to remove from the outer shell.																
1a(ii)	b or j	Elements c and k are group 0 elements as they have the highest 1 <sup>st</sup> ionisation energy in their periods. Group 7 elements have the next highest 1 <sup>st</sup> ionisation energy and elements b and j correspond to the 2 <sup>nd</sup> highest ionisation energies.																
1a(iii)A	Answer to include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%;">1<sup>st</sup> mark:</td> <td>2<sup>nd</sup> electron removed from an electron shell closer to nucleus</td> </tr> <tr> <td>2<sup>nd</sup> mark:</td> <td>2<sup>nd</sup> electron is less screened/shielded (than 1<sup>st</sup> electron removed) or 2<sup>nd</sup> electron is more strongly attracted to the nucleus</td> </tr> </table>	1 <sup>st</sup> mark:	2 <sup>nd</sup> electron removed from an electron shell closer to nucleus	2 <sup>nd</sup> mark:	2 <sup>nd</sup> electron is less screened/shielded (than 1 <sup>st</sup> electron removed) or 2 <sup>nd</sup> electron is more strongly attracted to the nucleus												
1 <sup>st</sup> mark:	2 <sup>nd</sup> electron removed from an electron shell closer to nucleus																	
2 <sup>nd</sup> mark:	2 <sup>nd</sup> electron is less screened/shielded (than 1 <sup>st</sup> electron removed) or 2 <sup>nd</sup> electron is more strongly attracted to the nucleus																	
1a(iii)B	11472	<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 5%; text-align: center;">❶</td> <td style="width: 20%;"><math>\text{Na}^+_{(g)}</math></td> <td style="width: 10%; text-align: center;"><math>\rightarrow</math></td> <td style="width: 20%;"><math>\text{Na}^{2+}_{(g)} + e^-</math></td> <td style="width: 10%; text-align: center;"><math>\Delta H = 4562 \text{ kJ mol}^{-1}</math></td> </tr> <tr> <td style="text-align: center;">❷</td> <td><math>\text{Na}^{2+}_{(g)}</math></td> <td style="text-align: center;"><math>\rightarrow</math></td> <td><math>\text{Na}^{3+}_{(g)} + e^-</math></td> <td style="text-align: center;"><math>\Delta H = 6910 \text{ kJ mol}^{-1}</math></td> </tr> <tr> <td style="text-align: center;">add</td> <td><math>\text{Na}^+_{(g)}</math></td> <td style="text-align: center;"><math>\rightarrow</math></td> <td><math>\text{Na}^{3+}_{(g)} + 2e^-</math></td> <td style="text-align: center;"><math>\Delta H = 11472 \text{ kJ mol}^{-1}</math></td> </tr> </table>	❶	$\text{Na}^+_{(g)}$	$\rightarrow$	$\text{Na}^{2+}_{(g)} + e^-$	$\Delta H = 4562 \text{ kJ mol}^{-1}$	❷	$\text{Na}^{2+}_{(g)}$	$\rightarrow$	$\text{Na}^{3+}_{(g)} + e^-$	$\Delta H = 6910 \text{ kJ mol}^{-1}$	add	$\text{Na}^+_{(g)}$	$\rightarrow$	$\text{Na}^{3+}_{(g)} + 2e^-$	$\Delta H = 11472 \text{ kJ mol}^{-1}$	
❶	$\text{Na}^+_{(g)}$	$\rightarrow$	$\text{Na}^{2+}_{(g)} + e^-$	$\Delta H = 4562 \text{ kJ mol}^{-1}$														
❷	$\text{Na}^{2+}_{(g)}$	$\rightarrow$	$\text{Na}^{3+}_{(g)} + e^-$	$\Delta H = 6910 \text{ kJ mol}^{-1}$														
add	$\text{Na}^+_{(g)}$	$\rightarrow$	$\text{Na}^{3+}_{(g)} + 2e^-$	$\Delta H = 11472 \text{ kJ mol}^{-1}$														
1b(i)	Attraction atom/nucleus has for electrons within a bond	Electronegativity is a measure of the attraction an atom involved in a bond has for the electrons of the bond (shared pair of electrons)																
1b(ii)	Answer to include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%;">1<sup>st</sup> mark:</td> <td>Increased screening/shielding effect (due to more shells)</td> </tr> <tr> <td>2<sup>nd</sup> mark:</td> <td>Attraction of nucleus/protons for outer electrons decreases</td> </tr> </table>	1 <sup>st</sup> mark:	Increased screening/shielding effect (due to more shells)	2 <sup>nd</sup> mark:	Attraction of nucleus/protons for outer electrons decreases												
1 <sup>st</sup> mark:	Increased screening/shielding effect (due to more shells)																	
2 <sup>nd</sup> mark:	Attraction of nucleus/protons for outer electrons decreases																	
1b(iii)	Strontium (or Barium or Radium)	Strongest reducing agents are found on the top right hand corner of the electrochemical series. First four in top right corner are group 1 elements and Strontium is the first group 2 element.																
2a(i)	Answer to Include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%;">1<sup>st</sup> mark:</td> <td>(intermolecular) forces increase going down a group</td> </tr> <tr> <td>2<sup>nd</sup> mark:</td> <td>London dispersion forces are forces broken between molecules</td> </tr> <tr> <td>3<sup>rd</sup> mark:</td> <td>The more electrons the stronger the LDFs</td> </tr> </table>	1 <sup>st</sup> mark:	(intermolecular) forces increase going down a group	2 <sup>nd</sup> mark:	London dispersion forces are forces broken between molecules	3 <sup>rd</sup> mark:	The more electrons the stronger the LDFs										
1 <sup>st</sup> mark:	(intermolecular) forces increase going down a group																	
2 <sup>nd</sup> mark:	London dispersion forces are forces broken between molecules																	
3 <sup>rd</sup> mark:	The more electrons the stronger the LDFs																	
2a(ii)	Hydrogen bonding	Hydrogen bonding occurs between molecules containing one of the following bonds: <table style="width: 100%; text-align: center; border-collapse: collapse;"> <tr> <td style="border: 1px solid black; padding: 2px;">N - H bond</td> <td style="border: 1px solid black; padding: 2px;">O - H bond</td> <td style="border: 1px solid black; padding: 2px;">H - F bond</td> </tr> </table>	N - H bond	O - H bond	H - F bond													
N - H bond	O - H bond	H - F bond																
2b(i)	34	<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 10%; text-align: center;">Desired equation</td> <td style="border: 1px solid black; padding: 5px; text-align: center;"><math>\text{Si} + 2\text{H}_2 \rightarrow \text{SiH}_4</math></td> </tr> <tr> <td style="text-align: center;">❶</td> <td><math>\text{SiH}_4 + 2\text{O}_2 \rightarrow \text{SiO}_2 + 2\text{H}_2\text{O} \quad \Delta H = -1517 \text{ kJ mol}^{-1}</math></td> </tr> <tr> <td style="text-align: center;">❷</td> <td><math>\text{Si} + \text{O}_2 \rightarrow \text{SiO}_2 \quad \Delta H = -911 \text{ kJ mol}^{-1}</math></td> </tr> <tr> <td style="text-align: center;">❸</td> <td><math>\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O} \quad \Delta H = -286 \text{ kJ mol}^{-1}</math></td> </tr> <tr> <td style="text-align: center;">❶ x -1</td> <td><del><math>\text{SiO}_2 + 2\text{H}_2\text{O} \rightarrow \text{SiH}_4 + 2\text{O}_2 \quad \Delta H = +1517 \text{ kJ mol}^{-1}</math></del></td> </tr> <tr> <td style="text-align: center;">❷</td> <td><del><math>\text{Si} + \text{O}_2 \rightarrow \text{SiO}_2 \quad \Delta H = -911 \text{ kJ mol}^{-1}</math></del></td> </tr> <tr> <td style="text-align: center;">❸ x 2</td> <td><del><math>2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O} \quad \Delta H = -572 \text{ kJ mol}^{-1}</math></del></td> </tr> <tr> <td style="text-align: center;">add</td> <td><math>\text{Si} + 2\text{H}_2 \rightarrow \text{SiH}_4 \quad \Delta H = +34 \text{ kJ mol}^{-1}</math></td> </tr> </table>	Desired equation	$\text{Si} + 2\text{H}_2 \rightarrow \text{SiH}_4$	❶	$\text{SiH}_4 + 2\text{O}_2 \rightarrow \text{SiO}_2 + 2\text{H}_2\text{O} \quad \Delta H = -1517 \text{ kJ mol}^{-1}$	❷	$\text{Si} + \text{O}_2 \rightarrow \text{SiO}_2 \quad \Delta H = -911 \text{ kJ mol}^{-1}$	❸	$\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O} \quad \Delta H = -286 \text{ kJ mol}^{-1}$	❶ x -1	<del><math>\text{SiO}_2 + 2\text{H}_2\text{O} \rightarrow \text{SiH}_4 + 2\text{O}_2 \quad \Delta H = +1517 \text{ kJ mol}^{-1}</math></del>	❷	<del><math>\text{Si} + \text{O}_2 \rightarrow \text{SiO}_2 \quad \Delta H = -911 \text{ kJ mol}^{-1}</math></del>	❸ x 2	<del><math>2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O} \quad \Delta H = -572 \text{ kJ mol}^{-1}</math></del>	add	$\text{Si} + 2\text{H}_2 \rightarrow \text{SiH}_4 \quad \Delta H = +34 \text{ kJ mol}^{-1}$
Desired equation	$\text{Si} + 2\text{H}_2 \rightarrow \text{SiH}_4$																	
❶	$\text{SiH}_4 + 2\text{O}_2 \rightarrow \text{SiO}_2 + 2\text{H}_2\text{O} \quad \Delta H = -1517 \text{ kJ mol}^{-1}$

1 <sup>st</sup> Mark:	Longer the carbon chain the higher the boiling point																													
2 <sup>nd</sup> Mark:	Further Down group 7 the halogen is the higher the boiling point																													
9a(ii)	Permanent dipole to permanent dipole attractions.	The carbon - halogen C-X bond is a polar bond due to the difference in electronegativities between the two elements. Permanent dipoles are formed when the electrons in the bond are shared unequally. The element with the higher electronegativity has a slightly negatively charge ( $\delta^-$ ). The halogen in the C=X bond will carry the $\delta^-$ charge. Permanent dipole to permanent dipole attractions bring the molecules closer together and raise the boiling point as a result.																												
9b(i)	One answer from:	<table border="1"> <tbody> <tr> <td>2 carbons attached to the carbon with the halogen attached.</td> </tr> <tr> <td>1 hydrogen attached to the carbon with the halogen attached.</td> </tr> </tbody> </table>	2 carbons attached to the carbon with the halogen attached.	1 hydrogen attached to the carbon with the halogen attached.																										
2 carbons attached to the carbon with the halogen attached.																														
1 hydrogen attached to the carbon with the halogen attached.																														
9b(ii)	$\begin{array}{c} \text{H} \quad \text{Br} \quad \text{H} \\   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \\   \quad   \quad   \\ \text{H} \quad \text{CH}_3 \quad \text{H} \end{array}$	To be an isomer of 2-bromobutane then must have formula $\text{C}_4\text{H}_9\text{Br}$ .  To be a tertiary haloalkane, structure must have three carbons/no hydrogens attached to the carbon with the bromine attached.																												
9c(i)	Ultraviolet light or u.v.	Ultraviolet light is required to provide the energy required to split the covalent bond in halogen in the initiation step.																												
9c(ii)	One answer from:	<table border="1"> <tbody> <tr> <td><math>2\text{Br}^\bullet \rightarrow \text{Br}_2</math> or <math>\text{Br}^\bullet + \text{Br}^\bullet \rightarrow \text{Br}_2</math></td> <td><math>\text{Br}^\bullet + \bullet\text{CH}_3 \rightarrow \text{CH}_3\text{Br}</math></td> <td><math>2^\bullet\text{CH}_3 \rightarrow \text{C}_2\text{H}_6</math> or <math>^\bullet\text{CH}_3 + \bullet\text{CH}_3 \rightarrow \text{C}_2\text{H}_6</math></td> </tr> </tbody> </table>	$2\text{Br}^\bullet \rightarrow \text{Br}_2$ or $\text{Br}^\bullet + \text{Br}^\bullet \rightarrow \text{Br}_2$	$\text{Br}^\bullet + \bullet\text{CH}_3 \rightarrow \text{CH}_3\text{Br}$	$2^\bullet\text{CH}_3 \rightarrow \text{C}_2\text{H}_6$ or $^\bullet\text{CH}_3 + \bullet\text{CH}_3 \rightarrow \text{C}_2\text{H}_6$																									
$2\text{Br}^\bullet \rightarrow \text{Br}_2$ or $\text{Br}^\bullet + \text{Br}^\bullet \rightarrow \text{Br}_2$	$\text{Br}^\bullet + \bullet\text{CH}_3 \rightarrow \text{CH}_3\text{Br}$	$2^\bullet\text{CH}_3 \rightarrow \text{C}_2\text{H}_6$ or $^\bullet\text{CH}_3 + \bullet\text{CH}_3 \rightarrow \text{C}_2\text{H}_6$

9e	Answer shown:	2-bromo-3-chloro-1,1,1-trifluoropentane																												

10a	Answer to include:	Mark	Version 1	Version 2	Version 3
		1 <sup>st</sup> Mark	Tare the balance with the crucible	Tare a weighing boat, transfer the 1.5 g onto the weighing boat. Record mass. Transfer into the crucible.	Weigh mixture and weighing boat, record the mass. Transfer mixture into the crucible.
2 <sup>nd</sup> Mark	Transfer 1.5 g (into the crucible)	Reweigh the weighing boat and record the mass/calculate the difference	Reweigh the weighing boat and record the mass/calculate the difference		
10b(i)	to allow gas/CO <sub>2</sub> to escape	The gas formed in the reaction will build up in the crucible under the lid. Lifting the lid will prevent. Pressure building up that could dislodge the lid.			
10b(ii)	reactants/products are not flammable	Bunsen burners should be replaced with non-flammable heating methods like hot plates and heating mantles when the reactants or products are flammable.			
10c	0.582	<p>mass of crucible before heating = 1.598g    mass of crucible after heating = 1.294g  mass of CO<sub>2</sub> released = 1.598g - 1.294g = 0.304g  gfm CO<sub>2</sub> = 44g</p> $\text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{0.304}{44} = 0.00691\text{mol}$ $\text{MgCO}_3 \longrightarrow \text{MgO} + \text{CO}_2$ <p style="text-align: center;"> <span style="margin-right: 100px;">1mol</span> <span>1mol</span> </p> <p style="text-align: center;"> <span style="margin-right: 100px;">0.00691mol</span> <span>0.00691mol</span> </p> <p>gfm MgCO<sub>3</sub> = 84.3g</p> <p>mass = no. of mol × gfm = 0.00691 × 84.3 = 0.582g</p>			
10d(i)	 <p>conical flask excess acid magnesium carbonate &amp; magnesium oxide</p>				
10d(ii)	carbon dioxide has low solubility in water	Only gases that are insoluble or have low solubility in water should be collect over water this water. There is some loss of gas during the process. The best way to collect CO <sub>2</sub> in a gas syringe so there is no loss of any gas by dissolving in water.
