2015 Higher Chemistry Marking Scheme

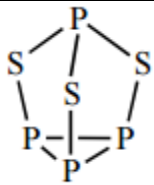

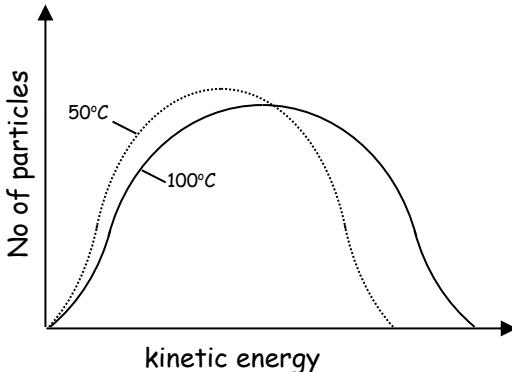

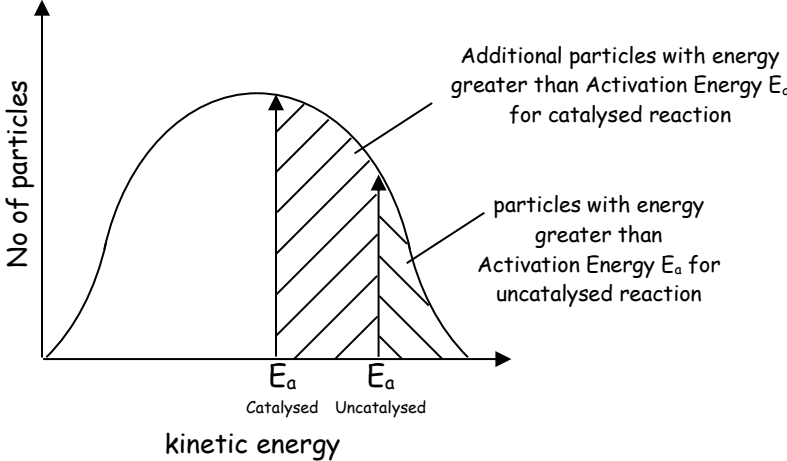

MC Qu	Answer	% Pupils Correct	Reasoning
1	C	73	<input checked="" type="checkbox"/> A isotopes have the same number of protons ∴ have the same number of electrons <input checked="" type="checkbox"/> B isotopes have different mass numbers and have different masses <input checked="" type="checkbox"/> C isotopes have the same atomic number and have the same number of protons <input checked="" type="checkbox"/> D isotopes have the same number of protons so have the same nuclear charge
2	B	60	<input checked="" type="checkbox"/> A Iodine is a non-metal element with no electrical conductivity <input checked="" type="checkbox"/> B potassium is a metal with a low melting point (63°C) and high electrical conductivity <input checked="" type="checkbox"/> C silicon dioxide is a covalent network and has no electrical conductivity <input checked="" type="checkbox"/> D potassium fluoride is ionic and has no electrical conductivity as a solid
3	C	71	<input checked="" type="checkbox"/> A rate of reaction increases as temperature increases (but graph shows rate decreasing) <input checked="" type="checkbox"/> B The graph shows the rate of reaction when an enzyme is involved in the reaction <input checked="" type="checkbox"/> C rate of reaction increases (exponentially) as temperature increases <input checked="" type="checkbox"/> D The graph is typical of the effect of temperature on radioactive half-life
4	B	55	$\text{Mg} + 2\text{H}^+ \longrightarrow \text{Mg}^{2+} + \text{H}_2$ $\begin{array}{cc} 1\text{mol} & 2\text{mol} \\ 0.1\text{mol} & 0.2\text{mol} \end{array}$ $\text{volume} = \frac{\text{no. of mol}}{\text{concentration}} = \frac{0.2 \text{ mol}}{4 \text{ mol l}^{-1}} = 0.05\text{litres} = 50\text{cm}^3$
5	D	65	<input checked="" type="checkbox"/> A displacement: higher up metal displaces a lower down metal ion from compound <input checked="" type="checkbox"/> B neutralisation: H ⁺ ions in acids react with bases/alkali to form water <input checked="" type="checkbox"/> C oxidation: increase in the oxygen : hydrogen ratio in carbon compounds <input checked="" type="checkbox"/> D precipitation: two ions meet and form insoluble precipitate which falls to the bottom
6	C	54	<input checked="" type="checkbox"/> A nail Q is protected from corrosion by sacrificial protection by higher up metal zinc <input checked="" type="checkbox"/> B nail P corrodes to protect copper by sacrificial protection and Fe ²⁺ cause blue colour <input checked="" type="checkbox"/> C nail P corrodes to protect copper by sacrificial protection and Fe ²⁺ cause blue colour <input checked="" type="checkbox"/> D nail Q is protected from corrosion by sacrificial protection by higher up metal zinc
7	B	82	$\text{Rate} = \frac{\Delta\text{quantity}}{\Delta\text{time}} = \frac{0.035 - 0.025}{20 - 10} = \frac{0.01}{10} = 0.001 \text{ mol l}^{-1} \text{ s}^{-1}$
8	A	80	<input checked="" type="checkbox"/> A 1 st ionisation energy decreases down a group as outer electrons easier to remove <input checked="" type="checkbox"/> B atomic size increases down a group as additional shells of electrons are added <input checked="" type="checkbox"/> C electronegativity decreases down a group <input checked="" type="checkbox"/> D melting point of group elements decreases going down group 1
9	C	85 <small>newH=89</small>	<input checked="" type="checkbox"/> A First ionisation energy forms a 1+ ion from the element in the gaseous state <input checked="" type="checkbox"/> B First ionisation energy forms a 1+ ion from the element in the gaseous state <input checked="" type="checkbox"/> C 1 st ionisation energy: removal of one mole of electron from one mole of atoms in the gaseous state. <input checked="" type="checkbox"/> D Element must be single atoms in the gaseous state before ionisation
10	B	81	Group 3 elements have a low 3 rd ionisation energy and a very high 4 th ionisation energy <ul style="list-style-type: none"> • removal of the 3rd electron creates a full outer shell • removal of the 4th electron breaks into a full outer shell
11	A	75	<input checked="" type="checkbox"/> A 1 st Electron Affinity: one mole of atoms gains one mole of electrons in the gaseous state <input checked="" type="checkbox"/> B Element must be single atoms in the gaseous state before gaining electron <input checked="" type="checkbox"/> C Element must be single atoms in the gaseous state before gaining electron <input checked="" type="checkbox"/> D Electron affinity forms negative ions as it <i>combines</i> with electrons
12	A	74 <small>newH=62</small>	<input checked="" type="checkbox"/> A X-Y: activation energy (E _a) for the forward reaction <input checked="" type="checkbox"/> B Y-X: would give a negative value but activation energy (E _a) must be endothermic <input checked="" type="checkbox"/> C Y-Z: would be the enthalpy change (ΔH) for the reverse reaction <input checked="" type="checkbox"/> D Z-Y: would be the enthalpy change (ΔH) for the forward reaction

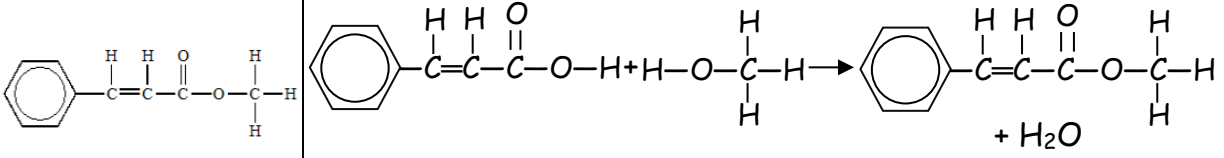

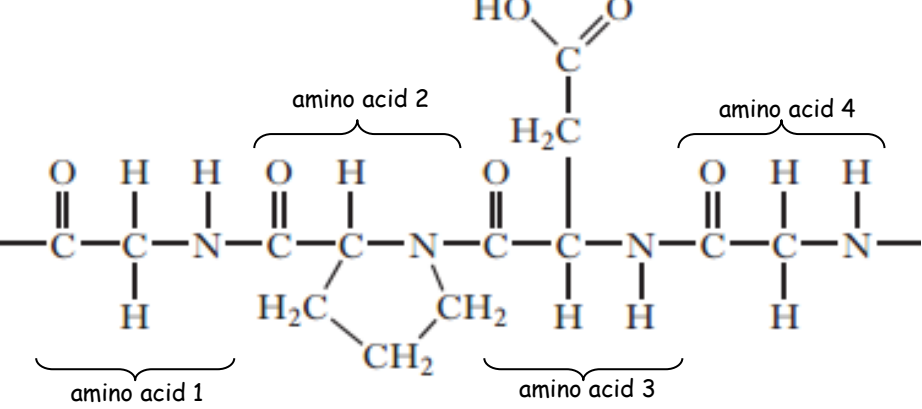

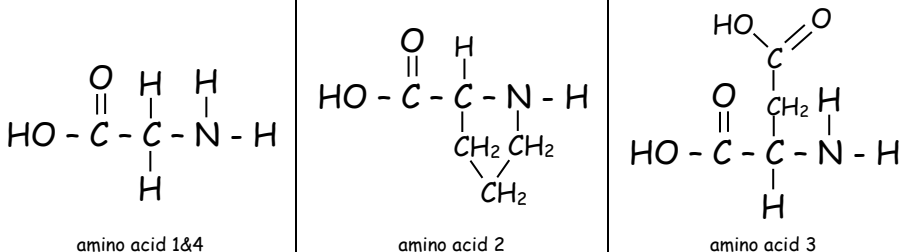

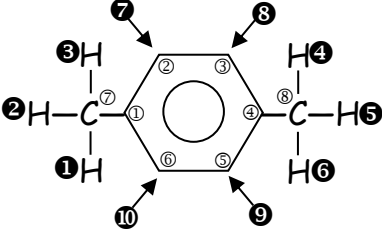

13	B	84	Enthalpy of Neutralisation: The energy change when one mole of water is formed in the neutralisation of an acid
14	D	58	<input type="checkbox"/> A 1mol Na ⁺ Cl ⁻ but 2 ions per f.u. ∴ 2mol of ions <input type="checkbox"/> B 1mol H ₂ molecules but 2 atoms per molecule ∴ 2mol of atoms <input type="checkbox"/> C 1mol of He atoms but 2 electrons per atom ∴ 2mol of electrons <input checked="" type="checkbox"/> D 1mol of O ₂ molecules
15	D	72	<input type="checkbox"/> A 1mol O ₂ molecules = 2mol of O atoms but 1mol of CO molecules = 1mol of O atoms <input type="checkbox"/> B 1mol O ₂ molecules = 2mol of O atoms but 0.5 mol CO ₂ molecules = 1 mol of O atoms <input type="checkbox"/> C 0.5mol O ₂ molecules = 1mol of O atoms but 1 mol CO ₂ molecules = 2 mol of O atoms <input checked="" type="checkbox"/> D 1mol O ₂ molecules = 2 mol of O atoms and 1 mol CO ₂ molecules = 2 mol of O atoms
16	D	51	<input type="checkbox"/> A not all gases are made of molecules as Noble gases are gases made of atoms <input type="checkbox"/> B number of electrons will vary depending on the elements inside the gas <input type="checkbox"/> C some gases are made of molecules of varying number of atoms inside ∴ no. of atoms will vary <input checked="" type="checkbox"/> D equal of volumes of gas (at same pressure and temp) will have the same number of moles of gas
17	D	51 revH=54	<input type="checkbox"/> A 1mol gas → 2mol gas: products have greater volume than reactants <input type="checkbox"/> B 1mol gas → 1mol gas: products have same volume than reactants <input type="checkbox"/> C zero mol of gas → 1mol gas: products have greater volume than reactants <input checked="" type="checkbox"/> D 2mol gas → zero mol of gas: products have less volume than reactants
18	C	26	$\text{gfm Na} = 23\text{g mol}^{-1} \quad \text{mass} = 4.6\text{g} \quad \text{Molar Volume} = 24\text{ litres mol}^{-1} \quad \text{Volume} = 4.8\text{ litres}$ $\text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{4.6\text{g}}{23\text{g mol}^{-1}} = 0.2\text{mol} \quad \text{no. of mol} = \frac{\text{Volume}}{\text{Molar Volume}} = \frac{4.8\text{ litres}}{24\text{ litres mol}^{-1}} = 0.2\text{mol}$ $\begin{array}{ccc} 4\text{Na} & + & \text{O}_2 & \longrightarrow & 2\text{Na}_2\text{O} \\ 4\text{mol} & & 1\text{mol} & & 2\text{mol} \\ 0.2\text{mol} & & 0.05\text{mol} & & \end{array}$ <p>0.05mol of O₂ reacts with 0.2mol of Na ∴ 0.15mol of O₂ (out of 0.2mol) is unreacted</p>
19	C	75	<input type="checkbox"/> A fractional distillation of crude oil must be the first step <input type="checkbox"/> B fractional distillation of crude oil must be the first step <input checked="" type="checkbox"/> C fractionating into fractions before reforming into branched chains before blending <input type="checkbox"/> D straight chains must be reformed into branched chains before blending
20	B	78	<p>2,2-dimethylpentan-1-ol has the molecular formula C₇H₁₅OH</p> <input type="checkbox"/> A CH ₃ CH ₂ CH ₂ CH(CH ₃)CH ₂ OH has the molecular formula of C ₆ H ₁₃ OH <input checked="" type="checkbox"/> B (CH ₃) ₃ CCH(CH ₃)CH ₂ OH has the molecular formula of C ₇ H ₁₅ OH ∴ isomer <input type="checkbox"/> C CH ₃ CH ₂ CH ₂ CH ₂ CH ₂ CH ₂ CH ₂ CH ₂ OH has the molecular formula of C ₈ H ₁₇ OH <input type="checkbox"/> D (CH ₃) ₂ CHC(CH ₃) ₂ CH ₂ CH ₂ OH has the molecular formula of C ₈ H ₁₇ OH
21	B	67	<input type="checkbox"/> A Hydrogen can be made from water or natural gas <input checked="" type="checkbox"/> B Methane (biogas) can be made from anaerobic fermentation of biological material <input type="checkbox"/> C Methanol is made from synthesis gas: CO + 2H ₂ → CH ₃ OH <input type="checkbox"/> D Petrol is made by reforming the naphtha fraction of crude oil
22	D	54	$n\text{CO} + (2n+1)\text{H}_2 \rightarrow n\text{H}_2\text{O} + \text{hydrocarbon}$ <p style="text-align: center;">Multiply out brackets</p> $n\text{CO} + 2n\text{H}_2 + \text{H}_2 \rightarrow n\text{H}_2\text{O} + \text{hydrocarbon}$ <p style="text-align: center;">Separate out H₂ which forms H₂O</p> $n\text{C} \cancel{\text{O}} + n\cancel{\text{H}_2} + n\text{H}_2 + \text{H}_2 \rightarrow n\cancel{\text{H}_2\text{O}} + \text{hydrocarbon}$ <p style="text-align: center;">Cancel out water</p> $n\text{C} + n\text{H}_2 + \text{H}_2 \rightarrow \text{hydrocarbon}$ <p style="text-align: center;">Build hydrocarbon into general formula</p> $\text{C}_n\text{H}_{2n} + \text{H}_2 \rightarrow \text{Hydrocarbon}$ $\text{C}_n\text{H}_{2n+2} = \text{Hydrocarbon}$
23	C	70	<p>Reaction X is hydration as water is added across a C=C double bond</p> <p>Reaction Y is oxidation as a secondary alcohol is converted into a ketone</p>

24	B	68	Diacid monomer must have 2 carboxyl groups to be a diacid and they should be on carbons C ₁ and C ₃ of benzene ring												
25	A	80	<input checked="" type="checkbox"/> A ozone absorbs harmful u.v. light which can cause skin cancer <input checked="" type="checkbox"/> B ozone absorbs u.v. light not reflect <input checked="" type="checkbox"/> C chlorofluorocarbons break down ozone <input checked="" type="checkbox"/> D chlorofluorocarbons were used as a refrigerant gas (and in aerosols in the past)												
26	D	68	Polyester can be a fibre or a resin. The correct answers for both types are: <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Use</th> <th>Property</th> <th>Structure</th> </tr> </thead> <tbody> <tr> <td>Resin</td> <td>Rigid</td> <td>Cross-linked</td> </tr> <tr> <td>Fibre</td> <td>Flexible</td> <td>Linear</td> </tr> </tbody> </table>	Use	Property	Structure	Resin	Rigid	Cross-linked	Fibre	Flexible	Linear			
Use	Property	Structure													
Resin	Rigid	Cross-linked													
Fibre	Flexible	Linear													
27	A	68	Nylon is former by condensation polymerisation. During a condensation reaction, two molecules join together and a small molecule is removed from where the two molecules join together. This small molecule is usually, but not always, water. In this example, a Cl atom is removed from the first monomer and an H atom is removed from the second monomer to form HCl.												
28	D	68	The polymer shown is poly(ethyne). The third bond in the triple bond takes part in the addition reaction as the ethyne monomer units polymerise together to make the long polymer chain leaving a double bond. This double bond is later altered to allow poly(ethyne) to be able to conduct electricity.												
29	B	80	<input checked="" type="checkbox"/> A dehydrogenation is the removal of hydrogen but this reaction adds hydrogen atoms <input checked="" type="checkbox"/> B this reaction is a hydrogenation reaction as hydrogen is added across C=C bonds <input checked="" type="checkbox"/> C hydrolysis reactions split the molecule into smaller units adding water at the break <input checked="" type="checkbox"/> D hydration reactions add water across a C=C double bond. 2mol H ₂ are added not H ₂ O												
30	C	63	<input checked="" type="checkbox"/> A This molecules has no C=C double bonds to react with bromine. <input checked="" type="checkbox"/> B This molecules is not a primary alcohol. Primary alcohols oxidise to an aldehyde. <input checked="" type="checkbox"/> C This molecule is a secondary alcohol and will oxidise to a ketone <input checked="" type="checkbox"/> D There are no C=C double bonds to allow addition polymerisation												
31	A	60	<input checked="" type="checkbox"/> A Full scale production is not a stage is new product development <input checked="" type="checkbox"/> B Pilot studies show whether a new product can be produced by the method profitably <input checked="" type="checkbox"/> C Research is an essential stage in the development of a new product <input checked="" type="checkbox"/> D Scaling up is necessary to develop a new product in the large quantities necessary												
32	D	70 newH=62 revH=73	<input checked="" type="checkbox"/> A $2\text{I}_{(g)} + 2e^- \longrightarrow 2\text{I}^-_{(g)}$ should have $\Delta H = 2 \times -349\text{kJ} = -698\text{kJ}$ <input checked="" type="checkbox"/> B $2\text{I}_{(g)} + 2e^- \longrightarrow 2\text{I}^-_{(g)}$ should have $\Delta H = 2 \times -349\text{kJ} = -698\text{kJ}$ <input checked="" type="checkbox"/> C $\text{I}_{2(g)} \longrightarrow 2\text{I}_{(g)}$ should have $\Delta H = +243\text{kJ}$ <input checked="" type="checkbox"/> D all steps have the correct enthalpy changes: <table style="margin-left: 20px; margin-top: 10px;"> <tbody> <tr> <td>Enthalpy of sublimation</td> <td>$\text{I}_{2(s)} \longrightarrow$</td> <td>$\text{I}_{2(g)}$</td> <td>$\Delta H = +60\text{kJ}$</td> </tr> <tr> <td>Bond dissociation of I₂</td> <td>$\text{I}_{2(g)} \longrightarrow$</td> <td>$2\text{I}_{(g)}$</td> <td>$\Delta H = +243\text{kJ}$</td> </tr> <tr> <td>2x electron affinity of iodine</td> <td>$2\text{I}_{(g)} + 2e^- \longrightarrow$</td> <td>$2\text{I}^-_{(g)}$</td> <td>$\Delta H = -698\text{kJ}$</td> </tr> </tbody> </table>	Enthalpy of sublimation	$\text{I}_{2(s)} \longrightarrow$	$\text{I}_{2(g)}$	$\Delta H = +60\text{kJ}$	Bond dissociation of I ₂	$\text{I}_{2(g)} \longrightarrow$	$2\text{I}_{(g)}$	$\Delta H = +243\text{kJ}$	2x electron affinity of iodine	$2\text{I}_{(g)} + 2e^- \longrightarrow$	$2\text{I}^-_{(g)}$	$\Delta H = -698\text{kJ}$
Enthalpy of sublimation	$\text{I}_{2(s)} \longrightarrow$	$\text{I}_{2(g)}$	$\Delta H = +60\text{kJ}$												
Bond dissociation of I ₂	$\text{I}_{2(g)} \longrightarrow$	$2\text{I}_{(g)}$	$\Delta H = +243\text{kJ}$												
2x electron affinity of iodine	$2\text{I}_{(g)} + 2e^- \longrightarrow$	$2\text{I}^-_{(g)}$	$\Delta H = -698\text{kJ}$												
33	A	64 newH=58 revH=69	$\Delta H_1 = \Delta H_2 + \Delta H_3 + \Delta H_4$ $\Delta H_4 = \Delta H_1 - \Delta H_2 - \Delta H_3$ $\Delta H_4 = -210 - (-50) - (-86)$ $\Delta H_4 = -74\text{kJ mol}^{-1}$ But ΔH for Z to Y = $+74\text{kJ mol}^{-1}$ <div style="text-align: right; margin-top: 10px;"> </div>												
34	A	87 newH=89 revH=88	<input checked="" type="checkbox"/> A at equilibrium rate of the forward reaction = rate of reverse reaction <input checked="" type="checkbox"/> B at equilibrium the concentration of reactants and products are constant not equal <input checked="" type="checkbox"/> C at equilibrium both forward and reverse reactions continue at equal rate <input checked="" type="checkbox"/> D catalysts do not change the position of equilibrium												
35	B	83 revH=84	<input checked="" type="checkbox"/> A Forward reaction: 2mol gas \rightarrow 1mol gas \therefore forward reaction decreases pressure <input checked="" type="checkbox"/> B Forward reaction: 2mol gas \rightarrow 2mol gas \therefore no change in pressure <input checked="" type="checkbox"/> C Forward reaction: 3mol gas \rightarrow 2mol gas \therefore forward reaction decreases pressure <input checked="" type="checkbox"/> D Forward reaction: 4mol gas \rightarrow 2mol gas \therefore forward reaction decreases pressure												

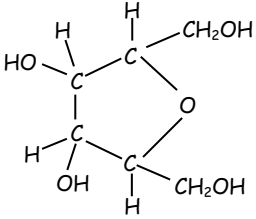

36	C	40 revH=33	<p>The red colour will fade as equilibrium shifts to right.</p> <p><input checked="" type="checkbox"/> A Equilibrium shifts to left as product (H^+) is added to equilibrium</p> <p><input checked="" type="checkbox"/> B Equilibrium shifts to left as product (Br^-) is added to equilibrium</p> <p><input checked="" type="checkbox"/> C Equilibrium shifts to right as product (Br^-) is removed by $Ag^+Br^-(s)$ precipitation</p> <p><input checked="" type="checkbox"/> D Equilibrium shifts to left as product (OBr^-) is added to equilibrium</p>																																													
37	D	56	<p><input checked="" type="checkbox"/> A $[OH^-]$ decreases as sodium hydroxide solution is diluted with water</p> <p><input checked="" type="checkbox"/> B $[OH^-]$ decreases as sodium hydroxide solution is diluted with water</p> <p><input checked="" type="checkbox"/> C Conductivity decreases as solution is diluted as there are less ions to conduct</p> <p><input checked="" type="checkbox"/> D Dilution of an alkali decreases $[OH^-]$, increases $[H^+]$ and decreases conductivity</p>																																													
38	A	54	<p>Lemon Juice: $pH=3 \therefore [H^+] = 10^{-3} \text{ mol l}^{-1}$</p> <p>Apple Juice: $pH=5 \therefore [H^+] = 10^{-5} \text{ mol l}^{-1}$</p> <p>$pH=3 \rightarrow pH=5$ is a decrease in concentration of H^+ by a factor of 100</p> <p style="text-align: center;">Lemon Juice : Apple Juice 100 : 1</p>

2015 Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning
1a	<div style="display: flex; justify-content: space-between; border-bottom: 1px solid black;"> London dispersion forces </div> <div style="text-align: center;">covalent bonds</div>	<p>The covalent bonds inside the S₈ rings do not break as the sulphur melts. When sulphur S₈ melts, London dispersion forces between the S₈ rings must be overcome but as these are weak then sulphur has a lower melting point.</p> <p>Silicon dioxide is a covalent network. Covalent bonds must be broken before a covalent network will melt into a liquid resulting in a high melting point.</p>
1b(i)		<p>Any structure for P₄S₃ that obeys the following valency rules:</p> <ul style="list-style-type: none"> • 3 bonds per P atoms • 2 bonds per S atom
1b(ii)	Increased nuclear attraction/charge or more protons in sulphur nucleus	Sulphur and phosphorus are in the same period of the periodic table and the same shell is being filled with electrons. Sulphur has 16 protons which pull in the outer shell of the sulphur atom further than the 15 protons in a phosphorus nucleus would do. Electrons closer to the nucleus are harder to remove.
1b(iii)	Greater number of London dispersion forces between S ₈ molecules than P ₄ molecules	Both P ₄ and S ₈ contain non-polar molecules. Both substances are solid at room temperature due to the number of London dispersion forces between the molecules which bring the molecules close enough to be a solid. Sulphur has a higher melting point than phosphorus due to greater numbers of London dispersion forces between molecules of 8 atoms than phosphorus atoms with only 4 atoms inside the molecule.
2a	45-46	<p>From graph: rate = 0.0022 s⁻¹</p> $\text{Rate} = \frac{1}{\text{time}} \therefore \text{time} = \frac{1}{\text{rate}} = \frac{1}{0.022} = 45\text{s}$
2b(i)	Curve and peak drawn to left of original curve	
2b(ii)	Line drawn to the left of the E _a line.	
3a	Diagram showing:	<p>1mark: workable apparatus for passing the steam through the strawberry gum (steam must pass through the strawberry gum leaves not just pass over)</p> <p>1mark: workable apparatus for condensing the steam and essential oil</p>

3b		<p>Methyl cinnamate is the ester formed from cinnamic acid and methanol</p>
3c	52%	<p>Cinnamic acid + methanol \longrightarrow methyl cinnamate + water</p> <p>1mol 1mol</p> <p>148g 162g</p> <p>6.5g $162g \times \frac{6.5}{148}$</p> <p style="margin-left: 250px;">$= 7.1g$ (theoretical)</p> <p>$\% \text{ yield} = \frac{\text{actual}}{\text{theoretical}} \times 100 = \frac{3.7}{7.1} \times 100 = 52\%$</p>
4a	Energy or vitamins	A balanced diet will contain the appropriate mix of carbohydrates, fats/oils, protein, fibre, vitamins and minerals
4b	Esters	Triglycerides are formed in the condensation reaction of three fatty acid molecules with glycerol. The fatty acid molecules have carboxyl groups which join to a hydroxyl group on glycerol. Water is removed as they join.
4c	hydrolysis	Hydrolysis is the breaking of fats/oils into three fatty acids and a glycerol molecule with three molecules of water added at the breaks.
5a	4	
5b	One from:	
6a(i)	More branched or ringed/aromatic molecules formed	Reforming of straight chain molecules in petrol into branched chain or ring/aromatic hydrocarbons keeps the molecules far enough apart when they are compressed so that they do not auto-ignite before the spark.
6a(ii)	C_8H_{10}	
6b(i)	Prevent loss by evaporation	Alcohol is a volatile liquid which evaporates quickly. Placing the lid on the spirit burner reduces evaporation of alcohol. Alcohol which evaporates does not release energy and makes the answer more inaccurate.

6b(ii)	-1015	$E_h = c \times m \times \Delta T$ <p>Energy = specific heat capacity \times mass \times change in temperature</p> $E_h = 4.18 \times 0.1 \times 21$ $E_h = 8.78 \text{ kJ}$ $1 \text{ mol } C_4H_9OH = (4 \times 12) + (10 \times 1) + (1 \times 16) = 48 + 10 + 16 = 74 \text{ g}$ $0.64 \text{ g} \leftrightarrow 8.78 \text{ kJ}$ $74 \text{ g} \leftrightarrow 8.78 \text{ kJ} \times 74 / 0.64$ $= -1015 \text{ kJ mol}^{-1}$																				
6c	Answer between -3325 to -3340	<table border="1"> <thead> <tr> <th>Alcohol</th> <th>Ethanol</th> <th>Propan-1-ol</th> <th>Butan-1-ol</th> <th>Pentan-1-ol</th> </tr> </thead> <tbody> <tr> <td>Enthalpy of Combustion (kJ mol⁻¹)</td> <td>-1367</td> <td>-2020</td> <td>-2676</td> <td>-</td> </tr> <tr> <td>Difference (kJ mol⁻¹)</td> <td></td> <td>653</td> <td>656</td> <td>(659)</td> </tr> <tr> <td>Prediction (kJ mol⁻¹)</td> <td>-</td> <td>-</td> <td>-</td> <td>-3335</td> </tr> </tbody> </table>	Alcohol	Ethanol	Propan-1-ol	Butan-1-ol	Pentan-1-ol	Enthalpy of Combustion (kJ mol ⁻¹)	-1367	-2020	-2676	-	Difference (kJ mol ⁻¹)		653	656	(659)	Prediction (kJ mol ⁻¹)	-	-	-	-3335

8a	Equation showing:	${}_{27}^{60}Co \longrightarrow {}_{28}^{60}Ni + {}_{-1}^0e$																				
8b	Gamma is high energy or very penetrating	Gamma radiation is high energy electromagnetic radiation. It needs a thick layer of lead metal to stop it and will penetrate the packaging and kill the bacteria inside to sterilise the insides of the package until it is opened.																				
8c(i)	21.08	<table border="1"> <thead> <tr> <th>Radioactivity</th> <th>Number of Half-lives</th> <th>Time (years)</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>0</td> <td>0</td> </tr> <tr> <td>$1/2$</td> <td>1</td> <td>$1 \times 5.27 = 5.27$</td> </tr> <tr> <td>$1/4$</td> <td>2</td> <td>$2 \times 5.27 = 10.54$</td> </tr> <tr> <td>$1/8$</td> <td>3</td> <td>$3 \times 5.27 = 15.81$</td> </tr> <tr> <td>$1/16$</td> <td>4</td> <td>$4 \times 5.27 = 21.08$</td> </tr> </tbody> </table>	Radioactivity	Number of Half-lives	Time (years)	1	0	0	$1/2$	1	$1 \times 5.27 = 5.27$	$1/4$	2	$2 \times 5.27 = 10.54$	$1/8$	3	$3 \times 5.27 = 15.81$	$1/16$	4	$4 \times 5.27 = 21.08$		
Radioactivity	Number of Half-lives	Time (years)																				
1	0	0																				
$1/2$	1	$1 \times 5.27 = 5.27$																				
$1/4$	2	$2 \times 5.27 = 10.54$																				
$1/8$	3	$3 \times 5.27 = 15.81$																				
$1/16$	4	$4 \times 5.27 = 21.08$																				
8c(ii)	No change	The half-life of a radioisotope is determined by the ratio of protons to neutrons. Changes in temperature, concentration, physical state and chemical state do not alter the half-life of the radioisotope.																				
9a(i)	Hydroxyl and carboxyl groups	$\begin{array}{c} O \\ \\ -C-OH \end{array} \quad \quad H-O-$ <p style="text-align: center;">carboxyl group hydroxyl group</p>																				
9a(ii)	forms hydrogen bonds with water	Hydrogen bonding is formed when N—H, O—H or H—F bonds interact with water molecules. These bonds are highly polar allowing the compounds containing these bonds to be soluble in a polar solvent like water.																				
9b	H ⁺ ions are not produced until dissolved in water	Acidity and alkalinity are water-based systems and no pH can be measured if water is absent. When water is added to solid citric acid, H ⁺ ions will dissociate from carboxyl group and can then react with hydrogencarbonate ions.																				

9c		Endothermic reactions take energy from the surroundings and lower the temperature in those surroundings. On a potential energy diagram the products are higher than the reactants. Exothermic reactions give heat to the surroundings and raise the temperature of the surroundings. On a potential energy diagram the products are lower than the reactants.																																																
9d	4.29 litres	$\text{gfm NaHCO}_3 = 84\text{g} \quad \text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{15\text{g}}{84\text{g}} = 0.179\text{mol}$ $\text{C}_6\text{H}_8\text{O}_7 + 3\text{NaHCO}_3 \longrightarrow \text{C}_6\text{H}_5\text{O}_7\text{Na}_3 + 3\text{H}_2\text{O} + 3\text{CO}_2$ $\begin{array}{ccccccc} & & 3\text{mol} & & & & 3\text{mol} \\ & & 1\text{mol} & & & & 1\text{mol} \\ & & 0.179\text{mol} & & & & 0.179\text{mol} \end{array}$ $\text{gfm CO}_2 = (1 \times 12) + (2 \times 16) = 12 + 32 = 44\text{g}$ $\text{Volume} = \text{no. of mol} \times \text{Molar Volume} = 0.179\text{mol} \times 24 \text{ litres mol}^{-1} = 4.29 \text{ litres}$																																																
10a	Acid which partially ionises/dissociates	Strong acids fully dissociate into ions e.g. hydrochloric acid, sulphuric acid Weak acids only partially dissociate with only a small percentage of the possible H ⁺ ions dissociated e.g. ethanoic acid, sulphurous acid																																																
10b	pH greater than 7	Sodium cyanide is made from sodium hydroxide (strong alkali) & hydrocyanic acid (weak acid) <ul style="list-style-type: none"> Salts made from strong acids and strong alkalis have pH=7 Salts made from weak acids and strong alkalis have pH>7 Salts made from strong acids and weak alkalis have pH<7

11a(i)	$\begin{array}{c} \text{--- C --- H} \\ \\ \text{O} \end{array}$	Aldehyde groups contain a carbonyl (C=O) group with a hydrogen atom attached. The carbon in the aldehyde group is always carbon number one in any numbering system assigned to an aldehyde when naming the compound.																																																
11a(ii)	Glucose/Fehling's mixture is heated	Fehling's solution and Benedict's solution both react with aldehyde groups giving a blue to brick red colour change. The reaction must be heated to speed up the reaction/colour change.																																																
11a(iii)	Blue to brick red	Colour change must be described as blue at start but the following colours are acceptable as the end colour: orange, (brick) red, yellow, brown, green																																																
11b		Problem Solving Question																																																
11c	Condensation	Condensation Polymerisation: small molecules (e.g. glucose) joining up to make a larger molecule (e.g. starch) with a small molecule (e.g. water) removed at the joins.																																																
11d	Answer to include:	Amylopectin molecules are unable to pack closely together due to shape and can separate more easily. (It has more readily accessible -OH groups.) Amylose molecules pack closer together and more difficult to separate.																																																
12a(i)	Flow chart complete with:	<p>1st Mark:</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="border: 1px solid black; padding: 2px;">ammonia</div> <div style="border: 1px solid black; padding: 2px;">calcium carbonate</div> </div> <div style="display: flex; justify-content: space-around; align-items: center; margin-top: 10px;"> <div style="border: 1px solid black; padding: 2px;">carbon dioxide</div> <div style="border: 1px solid black; padding: 2px;">calcium oxide</div> </div> <p>2nd Mark:</p> <div style="display: flex; justify-content: space-around; align-items: center; margin-top: 10px;"> <div style="border: 1px solid black; padding: 2px;">sodium hydrogencarbonate</div> <div style="border: 1px solid black; padding: 2px;">ammonium chloride</div> </div> <div style="display: flex; justify-content: center; align-items: center; margin-top: 10px;"> <div style="border: 1px solid black; padding: 2px;">water</div> </div> <div style="display: flex; justify-content: center; align-items: center; margin-top: 10px;"> <div style="border: 1px solid black; padding: 2px;">sodium carbonate</div> </div>																																																

12a(ii)	Calcium chloride/ byproducts can be sold	The calcium chloride can be sold for profit even though it is not the main product of the Solvay Process. If the calcium chloride is not sold for profit then it would have to be disposed of responsibly at a cost.
12b	Adding Na ⁺ shifts equilibrium to right	Brine contains Na ⁺ ions. Na ⁺ ions are a reactant in the reaction. When a reactant is added to a reaction at equilibrium, the equilibrium shifts to the right to make additional products and remove the additional Na ⁺ ions.
12c	+20 kJ mol ⁻¹	$\boxed{\text{CaCO}_3 + 2\text{NaCl} \rightarrow \text{Na}_2\text{CO}_3 + \text{CaCl}_2}$ <p> $\text{CaCO}_3 \rightarrow \text{CO}_2 + \text{CaO} \quad \Delta H = +178 \text{ kJ}$ $\text{CaO} + \text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 \quad \Delta H = -65 \text{ kJ}$ $\text{NaCl} + \text{NH}_3 + \text{CO}_2 + \text{H}_2\text{O} \rightarrow \text{NaHCO}_3 + \text{NH}_4\text{Cl} \quad \Delta H = -79 \text{ kJ}$ $2\text{NaHCO}_3 \rightarrow \text{Na}_2\text{CO}_3 + \text{H}_2\text{O} + \text{CO}_2 \quad \Delta H = +85 \text{ kJ}$ $\text{Ca(OH)}_2 + 2\text{NH}_4\text{Cl} \rightarrow \text{CaCl}_2 + 2\text{H}_2\text{O} + 2\text{NH}_3 \quad \Delta H = -20 \text{ kJ}$ </p> <p> $\text{CaCO}_3 \rightarrow \text{CO}_2 + \text{CaO} \quad \Delta H = +178 \text{ kJ}$ $\text{CaO} + \text{H}_2\text{O} \rightarrow \text{Ca(OH)}_2 \quad \Delta H = -65 \text{ kJ}$ $2 \times 2\text{NaCl} + 2\text{NH}_3 + 2\text{CO}_2 + 2\text{H}_2\text{O} \rightarrow 2\text{NaHCO}_3 + 2\text{NH}_4\text{Cl} \quad \Delta H = -158 \text{ kJ}$ $2\text{NaHCO}_3 \rightarrow \text{Na}_2\text{CO}_3 + \text{H}_2\text{O} + \text{CO}_2 \quad \Delta H = +85 \text{ kJ}$ $\text{Ca(OH)}_2 + 2\text{NH}_4\text{Cl} \rightarrow \text{CaCl}_2 + 2\text{H}_2\text{O} + 2\text{NH}_3 \quad \Delta H = -20 \text{ kJ}$ </p> <p>add $\text{CaCO}_3 + 2\text{NaCl} \rightarrow \text{Na}_2\text{CO}_3 + \text{CaCl}_2 \quad \Delta H = +20 \text{ kJ}$</p>
13a	Answer to include:	<p>1st mark: ammonia is polar and trichloramine is non-polar</p> <p>2nd mark: electronegativity difference is bigger in N-H bond than N-Cl bond \therefore NH₃ is polar and NCl is non-polar</p>
13b(i)	$2\text{I}^- \rightarrow \text{I}_2 + 2\text{e}^-$	<p>Redox equation: $\text{NaOCl} + 2\text{I}^- + 2\text{H}^+ \rightarrow \text{I}_2 + \text{NaCl} + \text{H}_2\text{O}$</p> <p>Oxidation step: $2\text{I}^- \rightarrow \text{I}_2 + 2\text{e}^-$</p> <p>Reduction step: $\text{NaOCl} + 2\text{H}^+ + 2\text{e}^- \rightarrow \text{NaCl} + \text{H}_2\text{O}$</p>
13b(ii)	Starch acts as an indicator	<p>Starch solution acts as indicator in this reaction. Starch turns blue/black in the presence of iodine and is colourless when there is no iodine present.</p> <p>The end point of a reaction is detected when all the iodine has reacted with the thiosulphate ions by the colour change blue/black to colourless.</p>
