18	C	43	<p><input checked="" type="checkbox"/> A Cr<sup>3+</sup> + 3e<sup>-</sup> → Cr is higher in the electrochemical series than the equation SO<sub>4</sub><sup>2-</sup> + 2H<sup>+</sup> + 2e<sup>-</sup> → SO<sub>3</sub><sup>2-</sup> + H<sub>2</sub>O is too low to turn Cr<sup>3+</sup> into Cr</p> <p><input checked="" type="checkbox"/> B Al<sup>3+</sup> + 3e<sup>-</sup> → Al is higher in the electrochemical series than the equation SO<sub>4</sub><sup>2-</sup> + 2H<sup>+</sup> + 2e<sup>-</sup> → SO<sub>3</sub><sup>2-</sup> + H<sub>2</sub>O is too low to turn Al<sup>3+</sup> into Al.</p> <p><input checked="" type="checkbox"/> C Fe<sup>3+</sup> + e<sup>-</sup> → Fe<sup>2+</sup>: Fe<sup>3+</sup> ions will reduce to Fe<sup>2+</sup> ions and is lower in electrochemical series than SO<sub>4</sub><sup>2-</sup> + H<sub>2</sub>O → SO<sub>4</sub><sup>2-</sup> + 2H<sup>+</sup> + 2e<sup>-</sup> (reversed as it is higher in ECS)</p> <p><input checked="" type="checkbox"/> D Sn<sup>4+</sup> + 2e<sup>-</sup> → Sn<sup>2+</sup> is higher in electrochemical series than the equation SO<sub>4</sub><sup>2-</sup> + 2H<sup>+</sup> + 2e<sup>-</sup> → SO<sub>3</sub><sup>2-</sup> + H<sub>2</sub>O is too low to turn Sn<sup>4+</sup> into Sn<sup>2+</sup>.</p>	
19	B	49	<p>Step 1: Write down main species in reaction NO<sub>3</sub><sup>-</sup> → NO</p> <p>Step 2: Balance all atoms other than O or H NO<sub>3</sub><sup>-</sup> → NO</p> <p>Step 3: Balance O atoms by adding H<sub>2</sub>O to the other side NO<sub>3</sub><sup>-</sup> → NO + 2H<sub>2</sub>O</p> <p>Step 4: Balance H atoms by adding H<sup>+</sup> to the other side NO<sub>3</sub><sup>-</sup> + 4H<sup>+</sup> → NO + 2H<sub>2</sub>O</p> <p>Step 5: Balance charge by adding electrons to the most positive side NO<sub>3</sub><sup>-</sup> + 4H<sup>+</sup> + 3e<sup>-</sup> → NO + 2H<sub>2</sub>O</p>	
20	B	59	<p>Increase in proportion of solid = Increase in rate of forward reaction</p> <p><input checked="" type="checkbox"/> A decrease in pressure increases the rate of the pressure-reducing reverse reaction</p> <p><input checked="" type="checkbox"/> B decrease in temp and increase in pressure both favour the forward reaction.</p> <p><input checked="" type="checkbox"/> C increase in temperature increases the rate of the endothermic reverse reaction</p> <p><input checked="" type="checkbox"/> D increase in temperature increases the rate of the endothermic reverse reaction</p>	

# 2018 Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning																
1a(i)	The attraction an atom/nucleus has for the electrons in a bond/shared electrons	Electronegativity is a measure of the attraction for the electrons in a bond by the nuclei at either end of that bond. Non-metals tend to have higher values of electronegativity and have a higher attraction for the electrons in a bond.																
1a(ii)	One answer from:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; text-align: center;">Increased shielding/ more shielding (from additional shells)</td> <td style="width: 50%; text-align: center;">Covalent radius increases/atom size increases/more shells so attraction of the nucleus/protons for the (outer/shared) electrons decreases</td> </tr> </table>	Increased shielding/ more shielding (from additional shells)	Covalent radius increases/atom size increases/more shells so attraction of the nucleus/protons for the (outer/shared) electrons decreases														
Increased shielding/ more shielding (from additional shells)	Covalent radius increases/atom size increases/more shells so attraction of the nucleus/protons for the (outer/shared) electrons decreases																	
1b	Answer to include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 33%; text-align: center;"><u>1 mark</u> (Intermolecular) forces/bonds increase (going down the group)</td> <td style="width: 33%; text-align: center;"><u>1 mark</u> London Dispersion Forces are the forces (broken) between the molecules</td> <td style="width: 33%; text-align: center;"><u>1 mark</u> The more electrons the stronger the London Dispersion Forces</td> </tr> </table>	<u>1 mark</u> (Intermolecular) forces/bonds increase (going down the group)	<u>1 mark</u> London Dispersion Forces are the forces (broken) between the molecules	<u>1 mark</u> The more electrons the stronger the London Dispersion Forces													
<u>1 mark</u> (Intermolecular) forces/bonds increase (going down the group)	<u>1 mark</u> London Dispersion Forces are the forces (broken) between the molecules	<u>1 mark</u> The more electrons the stronger the London Dispersion Forces																
2a	Increasing number of protons or increasing nuclear charge	Across a period the same outer shell is being filled by electrons. The number of protons in the nucleus is increasing as is the positive charge in the nucleus. The outer shell of electrons is pulled in closer to the nucleus due to electrostatic attraction making the atom size decrease.																
2b(i)		<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 25%;">Electronegativity</td> <td style="width: 25%;">Si=1.9</td> <td style="width: 25%;">P=2.2</td> <td style="width: 25%;">S=2.5</td> </tr> <tr> <td>Chlorine</td> <td>Cl=3.0</td> <td>Cl=3.0</td> <td>Cl=3.0</td> </tr> <tr> <td>Difference</td> <td>1.1</td> <td>0.8</td> <td>0.5</td> </tr> <tr> <td>Commentary</td> <td>Most polar bonds</td> <td>-</td> <td>Least polar bonds</td> </tr> </table>	Electronegativity	Si=1.9	P=2.2	S=2.5	Chlorine	Cl=3.0	Cl=3.0	Cl=3.0	Difference	1.1	0.8	0.5	Commentary	Most polar bonds	-	Least polar bonds
Electronegativity	Si=1.9	P=2.2	S=2.5															
Chlorine	Cl=3.0	Cl=3.0	Cl=3.0															
Difference	1.1	0.8	0.5															
Commentary	Most polar bonds	-	Least polar bonds															
2b(ii)	Answer to include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%; text-align: center;">1 mark</td> <td>Silicon tetrachloride and hexane are both non-polar</td> </tr> <tr> <td style="text-align: center;">1 mark</td> <td>Silicon tetrachloride is non-polar due to its tetrahedral shape (where polarities over molecule cancel out)</td> </tr> </table>	1 mark	Silicon tetrachloride and hexane are both non-polar	1 mark	Silicon tetrachloride is non-polar due to its tetrahedral shape (where polarities over molecule cancel out)												
1 mark	Silicon tetrachloride and hexane are both non-polar																	
1 mark	Silicon tetrachloride is non-polar due to its tetrahedral shape (where polarities over molecule cancel out)																	
2c(i)	Answer to include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%; text-align: center;">1 mark</td> <td>Silicon nitride is a covalent network</td> </tr> <tr> <td style="text-align: center;">1 mark</td> <td>Covalent bonds need to be broken before it will melt</td> </tr> </table>	1 mark	Silicon nitride is a covalent network	1 mark	Covalent bonds need to be broken before it will melt												
1 mark	Silicon nitride is a covalent network																	
1 mark	Covalent bonds need to be broken before it will melt																	
2c(ii)	17.9	$\text{atom economy} = \frac{140.3}{(3 \times 170.1) + (16 \times 17.0)} \times 100 = \frac{140.3}{510.3 + 272.0} \times 100 = 17.9\%$																
2d(i)	Answer to include:	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; text-align: center;">  </td> <td style="width: 50%; text-align: center;">  </td> </tr> </table>																
																		
2d(ii)	To supply activation energy	Although the reaction is exothermic, sufficient energy to form the activated complex initially must be supplied for the activation energy barrier to be overcome. Once the reaction gets going the exothermic reaction will provide the heat energy to maintain the reaction.																
3a	water bath or heating mantle or hot plate	A flame-based method of heating should not be used as the reactants and products are volatile and flammable.																
3b	To condense any escaping gases	The reactants and products in the formation of esters can have low enough boiling points to evaporate and escape from the test tube. A cold surface like a small test tube filled with cold water will give a surface for the escaping gases to condense on. (Be careful, condensing gases give off heat which will rapidly heat up the water in the cold test tube)																
3c(i)	water	$\text{benzoic Acid} + \text{methanol} \rightarrow \text{methyl benzoate} + \text{water}$ $\text{C}_6\text{H}_5\text{COOH} + \text{CH}_3\text{OH} \rightarrow \text{C}_6\text{H}_5\text{COOCH}_3 + \text{H}_2\text{O}$																

3c(ii)	Answer showing:	$\text{no. of mol } C_6H_5COOH = \frac{\text{mass}}{\text{gfm}} = \frac{5.0}{122} = 0.0410\text{mol}$ $\text{no. of mol } CH_3OH = \frac{\text{mass}}{\text{gfm}} = \frac{2.5}{32} = 0.0781\text{mol}$ $C_6H_5COOH + CH_3OH \rightarrow C_6H_5COOCH_3 + H_2O$ <p style="text-align: center;"> <span style="margin-right: 100px;">1mol</span> <span>1mol</span> </p> <p style="text-align: center;"> <span style="margin-right: 100px;">0.0410mol Available</span> <span>0.0410mol Required</span> </p> <p>0.0410mol <math>CH_3OH</math> required and 0.0781 mol <math>CH_3OH</math> available  <math>\therefore CH_3OH</math> in excess and <math>C_6H_5COOH</math> is limiting factor as a result.</p>															
3c(iii)	12.84	<p>500g Benzoic Acid. <math>\longrightarrow</math> £39.80  5g Benzoic acid. <math>\longrightarrow</math> £39.80 <math>\times</math> <math>5/500</math> = £0.3980  <math>\therefore</math> 3.1g methyl benzoate <math>\longrightarrow</math> £0.3980  100g methyl benzoate <math>\longrightarrow</math> £0.3980 <math>\times</math> <math>100/3.1</math>  = £12.84</p>

A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a <b>reasonable understanding</b> of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a <b>limited understanding</b> of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.									
3 mark answer	2 mark answer	1 mark answer															
Demonstrates a <b>good understanding</b> of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a <b>reasonable understanding</b> of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a <b>limited understanding</b> of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.															

6a(i)	Hydrolysis	$\text{C}_{15}\text{H}_{31}-\text{C} \begin{array}{l} \text{=O} \\ \text{O}-\text{C}_{20}\text{H}_{29} \end{array} + \text{H}_2\text{O}$												
6a(ii)	$\text{C}_{20}\text{H}_{29}\text{OH}$ or $\text{C}_{20}\text{H}_{30}\text{O}$	$\text{C}_{15}\text{H}_{31}-\text{C} \begin{array}{l} \text{=O} \\ \text{OH} \end{array} + \text{H}-\text{O}-\text{C}_{20}\text{H}_{29}$												
6b(i)	Bond breaking by u.v. light	The initiation step forms free radicals by breaking covalent bonds and free radical particles are formed with unpaired electrons e.g. $\text{Cl}-\text{Cl} \rightarrow \text{Cl}^\bullet + \text{Cl}^\bullet$												
6b(ii)	Propagation	<table border="1"> <thead> <tr> <th>Step</th> <th>Reactants (before Arrow)</th> <th>Products (after Arrow)</th> </tr> </thead> <tbody> <tr> <td>Initiation</td> <td>No free radicals on Reactant Side</td> <td>Free radicals on Product Side</td> </tr> <tr> <td>Propagation</td> <td colspan="2">Free Radicals found on both sides of arrow</td> </tr> <tr> <td>Termination</td> <td>Free radicals on Reactant Side</td> <td>No free radicals on Product Side</td> </tr> </tbody> </table>	Step	Reactants (before Arrow)	Products (after Arrow)	Initiation	No free radicals on Reactant Side	Free radicals on Product Side	Propagation	Free Radicals found on both sides of arrow		Termination	Free radicals on Reactant Side	No free radicals on Product Side
Step	Reactants (before Arrow)	Products (after Arrow)												
Initiation	No free radicals on Reactant Side	Free radicals on Product Side												
Propagation	Free Radicals found on both sides of arrow													
Termination	Free radicals on Reactant Side	No free radicals on Product Side												
6b(iii)	One answer from:	<table border="1"> <tbody> <tr> <td>Can react with free radicals to form stable molecules</td> <td>Donates electrons</td> <td>Acts as a reducing agent</td> <td>Provides electrons to pair with an unpaired electron</td> </tr> </tbody> </table>	Can react with free radicals to form stable molecules	Donates electrons	Acts as a reducing agent	Provides electrons to pair with an unpaired electron								
Can react with free radicals to form stable molecules	Donates electrons	Acts as a reducing agent	Provides electrons to pair with an unpaired electron											
6c(i)	$\begin{array}{c} \text{O} \quad \text{H} \\ \parallel \quad   \\ -\text{C}-\text{N}- \end{array}$													
6c(ii)														
7a(i)	One answer from:													
7a(ii)	Sesquiterpene	Isoprene (2-methylbuta-1,3-diene) has the formula $\text{C}_5\text{H}_8$ . Humulene has formula $\text{C}_{15}\text{H}_{24}$ and is formed when three $\text{C}_5\text{H}_8$ units join together.												
7b(i)	5.345	$1 \text{ flu vaccine} \longleftrightarrow 10.69 \text{ mg squalene}$ $500000 \text{ flu vaccines} \longleftrightarrow 10.69 \text{ mg squalene} \times \frac{500000}{1}$ $= 5345000 \text{ mg squalene}$ $= 5345 \text{ g squalene}$ $= 5.345 \text{ kg squalene}$												
7b(ii)	6	<p>1 mol of <math>\text{H}_2</math> will add across 1 mol <math>\text{C}=\text{C}</math> double bonds</p> <p>6 mol of <math>\text{H}_2</math> will add across 6 mol <math>\text{C}=\text{C}</math> double bonds</p> <p>1 mol of Squalene contains 6 mol <math>\text{C}=\text{C}</math> double bonds</p> <p><math>\therefore</math> 1 mol of squalene will react with 6 mol of <math>\text{H}_2</math></p>												

7c(i)	Addition or Hydration	Addition Reactions have a molecule adding across a C=C double bond or a C≡C triple bond. If the molecule adding across the C=C double bond is water then the reaction can also be described as hydration.																				
7c(ii)	Terpineol is a tertiary alcohol	Hot copper (II) oxide oxidises primary alcohols into carboxylic acids and oxidises secondary alcohols into ketones. Tertiary alcohols do not oxidise.
