A	77+
B	62+
C	47+
D	?
No award	?

2002 Higher Chemistry Marking Scheme

MC Qu	Answer	% Pupils Correct	Reasoning
1	D	81	<input checked="" type="checkbox"/> A $\text{HCl} \rightarrow \text{H}^+ + \text{Cl}^-$ <input checked="" type="checkbox"/> B not soluble in water so has no pH <input checked="" type="checkbox"/> C $\text{SO}_2 + \text{H}_2\text{O} \rightarrow \text{H}_2\text{SO}_3$ (sulphurous acid) $\rightarrow 2\text{H}^+ + \text{SO}_3^{2-}$ <input checked="" type="checkbox"/> D $\text{NH}_3 + \text{H}_2\text{O} \rightarrow \text{NH}_4^+ + \text{OH}^-$
2	C	52	$\text{Cu} + 2\text{Ag}^+\text{NO}_3^- \rightarrow 2\text{Ag} + \text{Cu}^{2+}(\text{NO}_3^-)_2$ (Displacement Reaction) $\text{Cu} + \text{Zn}(\text{NO}_3)_2 \rightarrow$ no reaction as copper is below zinc in reactivity series
3	B	52	$\text{Mg} + 2\text{HCl} \rightarrow \text{MgCl}_2 + \text{H}_2$ $\begin{matrix} 1\text{mol} & 2\text{mol} \\ 0.1\text{mol} & 0.2\text{mol} \end{matrix}$ $\text{volume} = \frac{\text{no. of mol}}{\text{concentration}} = \frac{0.2\text{mol}}{4\text{mol l}^{-1}} = 0.05\text{mol} = 50\text{cm}^3$
4	A	74	<input checked="" type="checkbox"/> A As mass of zinc is same and acid is in excess - same volume of gas produced and same mass lost <input checked="" type="checkbox"/> B concentrations different \therefore speed of reaction is different (2mol l^{-1} would finish first) <input checked="" type="checkbox"/> C 2mol l^{-1} acid would react faster initially than 1 mol l^{-1} <input checked="" type="checkbox"/> D Different initial speed of reactions would give different average rate of reaction
5	D	55	Activation energy is unaffected by changing temperature. Lower temperature reduces the energy of the collisions so less particles have enough energy to successfully collide and react.
6	A	64	ΔH measured from reactants to products ($-227 - 134 = -361\text{kJ mol}^{-1}$) NB Downhill overall so exothermic with negative sign.
7	C	74	<input checked="" type="checkbox"/> A Very little ionic bonding in water or ice <input checked="" type="checkbox"/> B polar covalent bonds inside molecules are unchanged during melting <input checked="" type="checkbox"/> C hydrogen bonding is much greater in ice than in water (hence ice has bigger volume) <input checked="" type="checkbox"/> D Water is a polar covalent substance due to electronegativity in the O-H bond
8	C	68	<input checked="" type="checkbox"/> A H-Cl is polar due to electronegativity difference ($\Delta\text{neg} = 3.0 - 2.2 = 0.8$) <input checked="" type="checkbox"/> B H_2O is polar due to electronegativity difference ($\Delta\text{neg} = 3.5 - 2.2 = 1.3$) <input checked="" type="checkbox"/> C CO_2 is non-polar due to linear shape despite electronegativity difference <input checked="" type="checkbox"/> D CHCl_3 (chloroform) is polar as C-H bond has $\Delta\text{neg} = 3.0 - 2.5 = 0.5$
9	A	67	Metal produced will be a solid as metal produced melts at 843°C and the temperature of the process is likely to be just above 772°C (the mpt of the metal chloride). Metal produced is less dense than the molten metal chloride so will float to the surface of the molten metal chloride.
10	A	60	<input checked="" type="checkbox"/> A 1mol of $\text{H}_2 = 2\text{g} \therefore \text{no. of mol H}_2 = \frac{\text{mass}}{\text{gfm}} = \frac{0.1}{2} = 0.05\text{mol}$ <input checked="" type="checkbox"/> B 1mol of $\text{NH}_3 = 17\text{g} \therefore \text{no. of mol H}_2 = \frac{\text{mass}}{\text{gfm}} = \frac{0.17}{17} = 0.01\text{mol}$ <input checked="" type="checkbox"/> C 1mol of $\text{CH}_4 = 16\text{g} \therefore \text{no. of mol H}_2 = \frac{\text{mass}}{\text{gfm}} = \frac{0.32}{16} = 0.02\text{mol}$ <input checked="" type="checkbox"/> D 1mol of $\text{Cl}_2 = 71\text{g} \therefore \text{no. of mol H}_2 = \frac{\text{mass}}{\text{gfm}} = \frac{0.35}{71} = 0.005\text{mol}$
11	C	41	$\text{C}_3\text{H}_8(\text{g}) + 5\text{O}_2(\text{g}) \rightarrow 3\text{CO}_2(\text{g}) + 4\text{H}_2\text{O}(\text{l})$ $\begin{matrix} 1\text{mol} & 5\text{mol} & 3\text{mol} & 4\text{mol} \\ 1\text{vol} & 5\text{vol} & 3\text{vol} & - \\ 50\text{cm}^3 & 250\text{cm}^3 & 150\text{cm}^3 & - \end{matrix}$ (NB Liquids have negligible volume compared to liquids) Resulting Volume = vol of CO_2 produced + vol of oxygen leftover = $150\text{cm}^3 \text{CO}_2 + 250\text{cm}^3 \text{leftover O}_2 = 400\text{cm}^3$
12	C	58	$1\text{mol } ^{12}\text{C} = 12\text{g} = 6.02 \times 10^{23} \text{ } ^{12}\text{C} \text{ atoms}$ $1\text{g} = 6.02 \times 10^{23} \text{ } ^{12}\text{C} \text{ atoms} \times \frac{1}{12} = 5.02 \times 10^{22} \text{ } ^{12}\text{C} \text{ atoms}$ But 12 protons/neutrons per ^{12}C atom $\rightarrow 5.02 \times 10^{22} \times 12 = 6.02 \times 10^{23}$ p+n But 3 quarks per proton/neutron $\rightarrow 6.02 \times 10^{23} \times 3 = 1.80 \times 10^{24}$ quarks
13	A	61	<input checked="" type="checkbox"/> A nitrogen dioxide is formed by the sparking of nitrogen & oxygen in an engine <input checked="" type="checkbox"/> B hydrocarbons are formed by incomplete combustion of fuel <input checked="" type="checkbox"/> C carbon (soot) is formed by incomplete combustion of fuel <input checked="" type="checkbox"/> D carbon monoxide is formed by incomplete combustion of fuel
14	B	60	<input checked="" type="checkbox"/> A Cracking: Larger molecules broken into smaller molecules, some with C=C bonds <input checked="" type="checkbox"/> B Reforming: Straight chain molecules turned into branched chained or rings <input checked="" type="checkbox"/> C Dehydration: water removed from molecules leaving a C=C double bond <input checked="" type="checkbox"/> D Addition Polymerisation: monomers with C=C bonds joining up to make polymer

15	B	61	Hexanal has structure $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CHO} \therefore \text{C}_6\text{H}_{12}\text{O}$ <input checked="" type="checkbox"/> A 2-methylbutanal has structure $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CHO} \therefore \text{C}_5\text{H}_{10}\text{O}$ <input checked="" type="checkbox"/> B 3-methylpentan-2-one has structure $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{COCH}_3 \therefore \text{C}_6\text{H}_{12}\text{O}$ <input checked="" type="checkbox"/> C 2,2-dimethylbutan-1-ol has structure $\text{CH}_3\text{CH}_2\text{C}(\text{CH}_3)_2\text{CH}_2\text{OH} \therefore \text{C}_6\text{H}_{14}\text{O}$ <input checked="" type="checkbox"/> D 3-ethylpentanal has structure $\text{CH}_3\text{CH}_2\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{CHO} \therefore \text{C}_7\text{H}_{14}\text{O}$
16	A	80	<input checked="" type="checkbox"/> A This is the ester produced from methanoic acid and ethanol <input checked="" type="checkbox"/> B This ester is methylethanoate made from ethanoic acid and methanol <input checked="" type="checkbox"/> C This is not an ester (it is an ether - see Advanced Higher) <input checked="" type="checkbox"/> D This is not an ester (it is the carboxylic acid called propanoic acid)
17	C	61	<input checked="" type="checkbox"/> A Benzene C_6H_6 and cyclohexane C_6H_{14} have different formulae <input checked="" type="checkbox"/> B Benzene has no C=C double bonds to react with bromine <input checked="" type="checkbox"/> C Benzene C_6H_6 and ethyne C_2H_2 have the same C:H ratio (ie 1:1) <input checked="" type="checkbox"/> D Benzene has no C=C double bonds to undergo addition reactions
18	C	61	<input checked="" type="checkbox"/> A Oxidation: ethanol (primary alcohol) \rightarrow ethanoic acid (carboxylic acid) <input checked="" type="checkbox"/> B Oxidation: propan-2-ol (secondary alcohol) \rightarrow propanone (ketone) <input checked="" type="checkbox"/> C Reduction: butanone (ketone) \rightarrow butan-2-ol (secondary alcohol) [reverse of oxidation] <input checked="" type="checkbox"/> D Oxidation: propanal (aldehyde) \rightarrow propanoic acid (carboxylic acid)
19	A	69	$\begin{array}{c} \text{CH}_3 \quad \text{H} \\ \quad \\ \text{C} = \text{C} \\ \quad \\ \text{H} \quad \text{CH}_3 \end{array}$ This monomer is but-2-ene
20	D	73	Synthesis gas is a mixture of carbon monoxide and hydrogen
21	B	71	<input checked="" type="checkbox"/> A poly(ethyne) is a polymer which is an electrical conductor <input checked="" type="checkbox"/> B poly(ethenol) is a polymer which is soluble <input checked="" type="checkbox"/> C Biopol is a polymer which is a biodegradable polymer <input checked="" type="checkbox"/> D Kevlar is a very strong polymer used in bullet-proof vests
22	C	82	Peptides are formed when the -H from an amino group (-NH ₂) of one amino acid and the -OH from a carboxylic acid group (-COOH) of a second amino acid are removed to form water as the molecules join together.
23	A	44	$\Delta H_1 = \Delta H_2 + \Delta H_3 + \Delta H_4$ $\Delta H_4 = \Delta H_1 - \Delta H_2 - \Delta H_3$ $\Delta H_4 = -210 - (-50) - (-86)$ $\Delta H_4 = -74\text{kJ mol}^{-1}$ But ΔH for Z to Y = +74kJ mol ⁻¹
24	D	75	Catalyst does not affect the position of equilibrium Value of ΔH is unchanged by addition of a catalyst.
25	D	55	<input checked="" type="checkbox"/> A Hydrogen in position A \rightarrow Aldehyde \therefore neutral <input checked="" type="checkbox"/> B Hydrogen in position B \rightarrow Alcohol \therefore neutral <input checked="" type="checkbox"/> C Hydrogen in position C \rightarrow Alkyl group \therefore neutral <input checked="" type="checkbox"/> D Hydrogen in position D \rightarrow Carboxylic acid \therefore acidic
26	A	91	<input checked="" type="checkbox"/> A pH of acids increase to 7 when diluted <input checked="" type="checkbox"/> B electrical conductivity decreases as acid is diluted <input checked="" type="checkbox"/> C diluted acids react slower with chalk <input checked="" type="checkbox"/> D the volume of alkali neutralised will not increase when an acid is diluted
27	B	56	<input checked="" type="checkbox"/> A This is a neutralisation reaction (acid + metal hydroxide \rightarrow salt + water) <input checked="" type="checkbox"/> B Redox: $\text{Zn} \rightarrow \text{Zn}^{2+} + 2\text{e}^-$ (oxidation) and $2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$ (reduction) <input checked="" type="checkbox"/> C This is a neutralisation reaction (acid + metal oxide \rightarrow salt + water) <input checked="" type="checkbox"/> D This is a neutralisation reaction (acid + metal carbonate \rightarrow salt + water + CO_2)
28	B	53	<input checked="" type="checkbox"/> A $\frac{1}{2}$ mol of each metal produced but 1 mol of Cu and 1 mol of Ni have different masses <input checked="" type="checkbox"/> B $\frac{1}{2}$ mol of each metal produced \therefore same number of atoms of each metal produced <input checked="" type="checkbox"/> C Metal ions are positive so will be deposited on the negative electrode <input checked="" type="checkbox"/> D $\frac{1}{2}$ mol of each metal produced as both metals have a two positive charge

29	D	46	Strontium has atomic number of 38 (date booklet) ∴ 38 protons. Number of neutrons = mass number - atomic number = 90 - 38 = 52 neutrons ∴ ratio of neutrons:protons = 52:38 = 1.37:1
30	B	71	<input checked="" type="checkbox"/> A Electron/ β -particle capture <input checked="" type="checkbox"/> B Fusion: Small nuclei join up to make a larger nucleus <input checked="" type="checkbox"/> C Fission: larger nucleus splits to form two smaller nuclei <input checked="" type="checkbox"/> D neutron capture followed by proton emission

Q31–35 are Grid Questions which are a style no longer used in Higher Chemistry.
However the content of the questions can still come up in future exams.

(If the question suggests there is more than 1 answer then there are 2 answers)

31a	E	<input checked="" type="checkbox"/> A aluminium is metallic <input checked="" type="checkbox"/> B boron forms a covalent network (high melting point) <input checked="" type="checkbox"/> C chlorine has discrete covalent Cl_2 molecules which are a gas at room temperature <input checked="" type="checkbox"/> D hydrogen has discrete covalent H_2 molecules which are a gas at room temperature <input checked="" type="checkbox"/> E Phosphorus forms discrete covalent P_4 molecules which is a solid at room temp <input checked="" type="checkbox"/> F Silicon forms a covalent network (high melting point)
31b	D+E (both for 1 mark)	Most covalent character ∴ elements with closest electronegativity Phosphorus and hydrogen both have electronegativity of 2.2
32a	D	<input checked="" type="checkbox"/> A ammonium nitrate is ionic as it contains metals and non-metals in compound. <input checked="" type="checkbox"/> B barium sulphate is ionic as it contains metals and non-metals in compound. <input checked="" type="checkbox"/> C sodium carbonate is ionic as it contains metals and non-metals in compound. <input checked="" type="checkbox"/> D SiO_2 is covalent and is covalent network due to its high melting point (1713°C) <input checked="" type="checkbox"/> E potassium oxide is ionic as it contains metals and non-metals in compound. <input checked="" type="checkbox"/> F phosphorus oxide is covalent molecular due to its low melting point (-98°C)
32b	C	<input checked="" type="checkbox"/> A acidic (made from strong acid and weak alkali) <input checked="" type="checkbox"/> B neutral (made from strong acid and strong alkali) <input checked="" type="checkbox"/> C alkaline (made from weak acid and strong alkali) <input checked="" type="checkbox"/> D SiO_2 is insoluble in water (e.g. sand) <input checked="" type="checkbox"/> E K_2O is not a salt! Salts are made by neutralising an acid with a base. <input checked="" type="checkbox"/> F non-metal oxides dissolve in water to make acids (e.g. CO_2 , SO_2 , NO_2 and P_2O_5)
33	C+D (1 mark each)	<input checked="" type="checkbox"/> A 1mol S atoms = 32.1g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{64.2}{32.1} = 2$ mol S atoms <input checked="" type="checkbox"/> B 1mol O molecules = 32g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{16}{32} = 0.5$ mol O molecules <input checked="" type="checkbox"/> C 1mol H_2O molecules = 18g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{6}{18} = \frac{1}{3}$ mol H_2O molecules ∴ 1mol atoms <input checked="" type="checkbox"/> D 1mol H_2 molecules = 2g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{1}{2} = \frac{1}{2}$ mol H_2 molecules ∴ 1mol protons <input checked="" type="checkbox"/> E no. of mol = ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = 2 \times 0.5 = 1$ mol H_2SO_4 formula units ∴ 2mol H^+ ions <input checked="" type="checkbox"/> F no. of mol = ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = 1 \times 1 = 1$ mol $\text{Ba}(\text{OH})_2$ formula units ∴ 2mol OH^- ions
34	C+E (1 mark each)	<input checked="" type="checkbox"/> A Fats are a more concentrated source of energy than carbohydrates (not proteins) <input checked="" type="checkbox"/> B Proteins are made by condensation polymerisation <input checked="" type="checkbox"/> C Denaturing changes the shape/structure of the protein <input checked="" type="checkbox"/> D Fibrous proteins are structural proteins. (globular proteins are shaped proteins like enzymes) <input checked="" type="checkbox"/> E Proteins always contain Carbon, Hydrogen, Oxygen and Nitrogen <input checked="" type="checkbox"/> F Both animals and proteins make protein from amino acids
35	B+F (1 mark each)	<input checked="" type="checkbox"/> A HCl (strong acid) will give red colour but CH_3COOH (weak acid) will give yellow colour <input checked="" type="checkbox"/> B strong and weak acids both have a pH below 7 <input checked="" type="checkbox"/> C HCl conducts better as it is fully ionised (more ions ∴ higher conductivity) <input checked="" type="checkbox"/> D HCl (strong acid) has higher H^+ ion concentration than CH_3COOH (weak acid) <input checked="" type="checkbox"/> E HCl (strong acid) reacts faster with Mg than CH_3COOH (weak acid) <input checked="" type="checkbox"/> F Same no of mol of H^+ ions in HCl and CH_3COOH ∴ same no. of mol of OH^- ions neutralised

2002 Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning																
1a	Electronegativity	Electronegativity is defined as the measure of the attraction an atom has for the shared electrons in a bond																
1b	Increases	The 1 st ionisation energy across a period increases due to the smaller atomic size across a period and the increasing nuclear charge holding those electrons.																
1c	1 st ionisation energy creates a stable outer shell. 2 nd ionisation energy breaks a stable outer shell	1 st Ionisation energy Equation: $\text{Na} \rightarrow \text{Na}^+ + e^-$ <div style="text-align: center;"> $\begin{matrix} 2,8,1 & 2,8 \\ \text{Na} & \text{Na}^+ \end{matrix}$ </div> 2 nd Ionisation energy Equation $\text{Na}^+ \rightarrow \text{Na}^{2+} + e^-$ <div style="text-align: center;"> $\begin{matrix} 2,8 & 2,7 \\ \text{Na}^+ & \text{Na}^{2+} \end{matrix}$ </div>																
2a	5800 years	when Radioactive Count Rate = 72 then time = 0 years when Radioactive Count Rate = 36 then time = 5800 years Time for radioactive count to half (half-life) = 5800 - 0 years = 5800 years																
2b	${}^{14}_6\text{C} \rightarrow {}^{14}_7\text{N} + {}^0_{-1}\text{e}$	β -emission: neutron splits into proton (stays in nucleus) and electron (emitted from nucleus) β -emission: atomic increases by 1 and mass number is unchanged																
2c	Fossil fuels take millions of years to form not thousands	Too many half lives of ${}^{14}\text{C}$ will have passed over the millions of years needed to form coal for accurate measurement of the radioactivity (not much ${}^{14}\text{C}$ is left!)																
3a(i)	Heterogeneous	Nickel is a solid catalyst and the olive oil reactant is a liquid Homogeneous catalyst: reactants and catalyst in same state Heterogeneous catalyst: reactants and catalyst in different states																
3a(ii)	Fat molecules are saturated (no C=C bonds)	Fat molecules are solids because they fit closely together as they are straight-chain molecules due to saturated carbon chains. Oils are liquids at room temp as they contain unsaturated carbon chains contain C=C bonds. These are bent in shape and prevent the oil molecules being close enough together to be a solid.																
3b(i)	Glycerol (or propane-1,2,3-triol)	Fats & Oils are made of glycerol and 3 fatty acids joined together by condensation polymerisation. In this reaction, hydrolysis of fats & oils releases glycerol and 3 fatty acids and then the fatty acids react with the alkali NaOH.																
3b(ii)	soaps/detergents	Sodium salts of fatty acids are used as soaps/detergents as they are soluble in both fats and water																
4a(i)	$\text{FeS} + 2\text{HCl} \rightarrow \text{FeCl}_2 + \text{H}_2\text{S}$	iron (II) sulphide + hydrochloric acid → iron (II) chloride + hydrogen sulphide <div style="text-align: center;"> $\begin{matrix} \text{FeS} & & 2\text{HCl} & & \text{FeCl}_2 & & \text{H}_2\text{S} \end{matrix}$ </div>																
4a(ii)	Hydrogen gas	metal + acid → salt + hydrogen iron + hydrochloric acid → iron (II) chloride + hydrogen																
4b	-20 kJ mol ⁻¹	Equation ①x-1: $\text{H}_2\text{O} + \text{SO}_2 \rightarrow \text{H}_2\text{S} + 1\frac{1}{2}\text{O}_2$ $\Delta H = +563\text{kJ}$ Equation ②: $\text{S} + \text{O}_2 \rightarrow \text{SO}_2$ $\Delta H = -297\text{kJ}$ Equation ③: $\text{H}_2 + \frac{1}{2}\text{O}_2 \rightarrow \text{H}_2\text{O}$ $\Delta H = -286\text{kJ}$ Add ①+②+③ $\text{H}_2 + \text{S} \rightarrow \text{H}_2\text{S}$ $\Delta H = -20\text{kJ mol}^{-1}$																
5a(i)	$\begin{array}{cccc} \text{H} & \text{H} & \text{H} & \text{H} \\ & & & \\ \text{H}-\text{C}-\text{C}-\text{C}=\text{C}-\text{H} \\ & & & \\ \text{H} & \text{H} & & \end{array}$	C=C double bonds must be located between C ₁ and C ₂ as step 2 has H ₂ O added across this C=C double bond and -OH ends up on C ₁																
5a(ii)	Hydration (or addition)	Water is added across a C=C double bond ∴ hydration reaction																
5a(iii)	orange → green	<table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">Oxidising agent</th> <th style="text-align: center;">Start Colour</th> <th style="text-align: center;">End Colour</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">Acidified Dichromate</td> <td style="text-align: center;">Orange</td> <td style="text-align: center;">Green</td> </tr> <tr> <td style="text-align: center;">Benedict's/Fehling's</td> <td style="text-align: center;">Blue</td> <td style="text-align: center;">Brick Red (orange)</td> </tr> <tr> <td style="text-align: center;">Hot copper (II) oxide</td> <td style="text-align: center;">Black</td> <td style="text-align: center;">Brown</td> </tr> <tr> <td style="text-align: center;">Tollen's Reagent</td> <td style="text-align: center;">(Colourless)</td> <td style="text-align: center;">Silver mirror produced</td> </tr> </tbody> </table>	Oxidising agent	Start Colour	End Colour	Acidified Dichromate	Orange	Green	Benedict's/Fehling's	Blue	Brick Red (orange)	Hot copper (II) oxide	Black	Brown	Tollen's Reagent	(Colourless)	Silver mirror produced	
Oxidising agent	Start Colour	End Colour																
Acidified Dichromate	Orange	Green																
Benedict's/Fehling's	Blue	Brick Red (orange)																
Hot copper (II) oxide	Black	Brown																
Tollen's Reagent	(Colourless)	Silver mirror produced																
5a(iv)	Butanoic acid	<p style="text-align: center;">CH₃CH₂CH₂CH₂OH is a primary alcohol so oxidises to butanoic acid</p> <table border="1" style="margin-left: auto; margin-right: auto; border-collapse: collapse;"> <tbody> <tr> <td rowspan="3" style="text-align: center; vertical-align: middle;">Oxidation of alcohols</td> <td style="text-align: center;">Primary alcohol</td> <td style="text-align: center;">→</td> <td style="text-align: center;">Aldehyde</td> <td style="text-align: center;">→</td> <td style="text-align: center;">Carboxylic acid</td> </tr> <tr> <td style="text-align: center;">Secondary alcohol</td> <td style="text-align: center;">→</td> <td style="text-align: center;">ketone</td> <td style="text-align: center;">→</td> <td style="text-align: center;">[No oxidation]</td> </tr> <tr> <td style="text-align: center;">Tertiary alcohol</td> <td style="text-align: center;">→</td> <td style="text-align: center;">×</td> <td style="text-align: center;">→</td> <td style="text-align: center;">[No oxidation]</td> </tr> </tbody> </table>	Oxidation of alcohols	Primary alcohol	→	Aldehyde	→	Carboxylic acid	Secondary alcohol	→	ketone	→	[No oxidation]	Tertiary alcohol	→	×	→	[No oxidation]
Oxidation of alcohols	Primary alcohol	→		Aldehyde	→	Carboxylic acid												
	Secondary alcohol	→		ketone	→	[No oxidation]												
	Tertiary alcohol	→	×	→	[No oxidation]													

5b(i)	Nice smell or layer on top formed	Esters are not soluble in water and will float on top of water. Ester often have a nice smell.
5b(ii)	1 from: Flavourings, solvents or perfumes	Esters are used as flavourings, solvents and perfumes
6a	To allow maximum transfer of heat to the water.	Heat from burning food must transfer to the water as efficiently as possible and the highest temperature read from the thermometer.
6b	Incomplete combustion or error in reading highest temp	Or other reasonable answer
6c	-1365.6kJ mol ⁻¹	$\Delta H = cm\Delta T = 4.18 \times 0.4 \times 17.4 = 29.09 \text{ kJ}$ 1mol of ethanol $C_2H_5OH = (2 \times 12) + (6 \times 1) + (1 \times 16) = 24 + 6 + 16 = 46 \text{g}$ 0.980g \longleftrightarrow 29.09 kJ 46g \longleftrightarrow 29.09 kJ $\times \frac{46}{0.980} = 1365.6 \text{ kJ mol}^{-1}$ Exothermic reaction $= -1365.6 \text{ kJ mol}^{-1}$
7a	Van der Waals' forces	Hydrogen and fluorine are both diatomic pure covalent molecules. The only forces of attraction must be Van der Waals attractions.
7b	Hydrogen bonding between H-F molecules	H-F has hydrogen bonding between molecules which means that H-F molecules are going to be much closer to one another than H-H or F-F which both only have weak Van der Waals between the molecules.
8a(i)	precipitation	$Ag^+(aq) + Cl^-(aq) \rightarrow Ag^+Cl^-(s)$
8a(ii)	AgNO ₃ in excess	gfm AgNO ₃ = 107.9 + 14 + (3×16) = 169.9g no. of mol AgNO ₃ = mass/gfm = 0.2/169.9 = 0.001177mol no. of mol HCl = volume × concentration = 0.02 × 0.0010 = 0.00002mol $AgNO_3 + HCl \rightarrow AgCl + HNO_3$ 1mol 1mol 0.001177mol 0.001177mol (AgNO ₃ in excess as only 0.00002 mol HCl available)
8b(i)	Fully dissociated acid (or fully ionises)	Strong acids fully dissociate e.g. hydrochloric, sulphuric and nitric Weak acids only partially dissociate e.g. $CH_3COOH \rightleftharpoons CH_3COO^- + H^+$
8b(ii)	pH=3	$[H^+] = 0.001 \text{ mol l}^{-1} = 10^{-3} \therefore \log_{10}[H^+] = -3 \therefore -\log_{10}[H^+] = 3 \therefore \text{pH} = 3$
9a(i)	0.0155	rate = $\frac{\Delta \text{quantity}}{\Delta \text{time}} = \frac{59.99 - 59.68}{20 - 0} = 0.0155 \text{ g min}^{-1}$
9a(ii)	Higher the pH the better the enzyme's efficiency up to pH=10 (efficiency decreases at pH=14)	More mass is lost over 50 minutes from pH=1 → pH=10 ∴ enzyme working better. At pH=14 the mass loss is reduced showing the enzyme does not work better at very alkaline conditions
9b	Count bubbles of gas or measure volume of gas released.	The mass loss is a measure of the amount of gas being released.
10a	Contact: O ₂ Haber: N ₂	Contact: O ₂ is obtained from air but SO ₂ has to be made from burning sulphur Haber: N ₂ is obtained from air but H ₂ has to be extracted from either water or natural gas
10b	Increased temp favours endo. reaction - endo. reaction removes products	Increasing temperature favours the endothermic reaction. Equilibrium moves to left (the endothermic reaction) to remove heat and less products formed.
10c	Equilibrium in Haber Process lies more to the left than in the Contact process	Contact Process: $2SO_2(g) + O_2(g) \rightarrow 2SO_3(g)$: 3vol → 2vol Haber Process: $N_2(g) + 3H_2(g) \rightarrow 2NH_3(g)$: 4vol → 2vol (not a pressure consideration) The pressure is raised in the Haber Process because the equilibrium lies more to the left. In Contact Process the equilibrium lies more to the right and the pressure should only be raised if necessary due to cost/safety considerations
10d	57.4%	gfm H ₂ = (2×1) = 2g gfm NH ₃ = (1×14)+(3×1) = 14 + 3 = 17g $N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$ 1mol 3mol 2mol 28g 6g 34g 200g 34g × 200/6 = 1133g 200kg 1133kg (theoretical) $\% \text{ Yield} = \frac{\text{Actual}}{\text{Theoretical}} \times 100 = \frac{650}{1133} \times 100 = 57.4\%$

11a(i)	$\begin{array}{c} \text{H} \quad \text{H} \\ \quad \\ \text{H} - \text{C} = \text{C} - \text{C} \equiv \text{N} \end{array}$	-C≡N as carbon makes 4 bonds and N makes 3 bonds C=C as end carbon makes 2 bonds with H leaving 2 bonds for the C=C bond
11a(ii)	Addition	Monomer contains C=C double bond ∴ addition polymerisation
11b	$2\text{CH}_2\text{CHCN} + 2\text{H}_2\text{O} + 2\text{e}^-$ \downarrow $(\text{CH}_2\text{CH}_2\text{CN})_2 + 2\text{OH}^-$	1. Write down chemicals $\text{CH}_2\text{CHCN} \rightarrow (\text{CH}_2\text{CH}_2\text{CN})_2 + \text{OH}^-$ 2. Balance all elements other than O and H $2\text{CH}_2\text{CHCN} \rightarrow (\text{CH}_2\text{CH}_2\text{CN})_2 + \text{OH}^-$ 3. Add H ₂ O to other side to balance O atoms $2\text{CH}_2\text{CHCN} + \text{H}_2\text{O} \rightarrow (\text{CH}_2\text{CH}_2\text{CN})_2 + \text{OH}^-$ 4. Add H ⁺ to other side to balance H atoms $2\text{CH}_2\text{CHCN} + 2\text{H}_2\text{O} \rightarrow (\text{CH}_2\text{CH}_2\text{CN})_2 + 2\text{OH}^-$ 5. Balance charge by electrons to one +ve side $2\text{CH}_2\text{CHCN} + 2\text{H}_2\text{O} + 2\text{e}^- \rightarrow (\text{CH}_2\text{CH}_2\text{CN})_2 + 2\text{OH}^-$
12a	Water will not heat up to 112°C	Temperature of 112°C required to decompose sodium hydrogen carbonate. Water boils at 100°C into steam so oil is used as it boil above 112°C
12b(i)	0.23 litres (or 230cm ³)	$\text{gfm NaHCO}_3 = 23 + 1 + 12 + (3 \times 16) = 23 + 1 + 12 + 48 = 84\text{g}$ $\text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{1.68}{84} = 0.02\text{mol}$ $2\text{NaHCO}_3 \longrightarrow \text{Na}_2\text{CO}_3 + \text{CO}_2 + \text{H}_2\text{O}$ $\begin{array}{ccc} 2\text{mol} & & 1\text{mol} \\ 0.02\text{mol} & & 0.01\text{mol} \end{array}$ Volume = no. of mol x Molar Volume = 0.01mol x 23 litres mol ⁻¹ = 0.23 litres
12b(ii)	CO ₂ dissolves in water	CO ₂ is partially soluble in water and a small amount will dissolve in the water in the measuring cylinder as it bubbles to the surface.
13a	Aldehyde	R groups are not defined so aldehyde is the better answer. If R is an alkyl group (methyl, ethyl, etc) then alkanals would be an appropriate answer
13b	4-methylpent-2-ene	R' is a -CH ₃ group R'' is a -CH(CH ₃)CH ₃ group R'-CH=CH-R'' → CH ₃ CH=CHCH(CH ₃)CH ₃ → 4-methylpent-2-ene
14a	5.54x10 ⁻⁶ mol	$Q = It = 0.010\text{A} \times (60 + 37)\text{seconds} = 0.010 \times 97 = 0.97\text{C}$ $2\text{I}^- \rightarrow \text{I}_2 + 2\text{e}^-$ $\begin{array}{ccc} 1\text{mol} & 2\text{mol} & \\ 1\text{mol} & 2 \times 96500\text{C} & \\ 1\text{mol} & 193000\text{C} & \\ 0.97 / 193000 \times 1\text{mol} & & 0.97\text{C} \\ = 5.03 \times 10^{-6}\text{mol} & & \end{array}$
14b(i)	starch indicator	Starch will turn blue/black in the presence of Iodine. (When the thiosulphate ions run out, iodine will remain to react with starch)
14b(ii)	8 x 10 ⁻³ (or 0.008)	$\text{I}_2 + 2\text{S}_2\text{O}_3^{2-} \longrightarrow 2\text{I}^- + \text{S}_4\text{O}_6^{2-}$ $\begin{array}{ccc} 1\text{mol} & 2\text{mol} & \\ 1.2 \times 10^{-5}\text{mol} & 2.4 \times 10^{-5}\text{mol} & \end{array}$ $\text{concentration} = \frac{\text{no. of mol}}{\text{volume}} = \frac{2.4 \times 10^{-5}\text{mol}}{0.003\text{litres}} = 0.008\text{mol l}^{-1} = 8 \times 10^{-3}\text{mol l}^{-1}$
14b(iii)	Remove iodine layer regularly to keep electrode conducting	Iodine is a solid forming on the outside of the positive electrode. Iodine is a non-metal so does not conduct. Eventually positive electrode will stop conducting when the iodine completely coats the electrode.
15a(i)	2H ₂ + O ₂ → 2H ₂ O	Equation ① x 2: $2\text{H}_2 \rightarrow 4\text{H}^+ + 4\text{e}^-$ Equation ②: $\text{O}_2 + 4\text{H}^+ + 4\text{e}^- \rightarrow 2\text{H}_2\text{O}$ Add ① + ②: $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$
15a(ii)	Arrow from Left (H ₂) side to Right (O ₂) side	Electrons are produced by hydrogen (which enters on Left) Electrons are accepted by oxygen (which enters on Right)
15b	No CO ₂ gas produced in this fuel cell	Petrol, and other fossil fuels, produce CO ₂ when burned. This fuel cell does not produce any CO ₂ as there is no carbon in any of the reactants.
