	<b>= 340kg</b>																				
	(theoretical)																				

24	B	56	<input checked="" type="checkbox"/> A methanol is made by reacting synthesis gas: $\text{CO} + 2\text{H}_2 \rightarrow \text{CH}_3\text{OH}$ <input checked="" type="checkbox"/> B Alkenes must have 2 carbons for a C=C double bond i.e. methene does not exist <input checked="" type="checkbox"/> C methanol is oxidised to methanal which is further oxidised to methanoic acid <input checked="" type="checkbox"/> D acidified potassium dichromate will oxidise methanol to methanal																	
25	A	56	<input checked="" type="checkbox"/> A This is the diacid monomer used for the polyester formed <input checked="" type="checkbox"/> B Carboxylic Acid groups must be on carbons 1 + 3 to form polyester as shown <input checked="" type="checkbox"/> C Molecule drawn is a diol not a diacid <input checked="" type="checkbox"/> D There is no $-\text{CH}_2\text{CH}_2-$ group between benzene and $-\text{COOH}$ carboxyl group																	
26	B	42	<input checked="" type="checkbox"/> A Single esters are used for flavourings, perfumes and solvents <input checked="" type="checkbox"/> B Polymeric esters are long chain polymer polyesters used in fibres and resins <input checked="" type="checkbox"/> C Polyester resins contain cross-links but polyester fibres are straight molecules <input checked="" type="checkbox"/> D Protein is the polymer made by condensation polymerisation of amino acids																	
27	C	88	Enzymes are denatured by temperatures above the optimum temperature (usually body temperature $37^\circ\text{C}$ ) as they change shape and no longer catalyse their chemical reaction.																	
28	B	82	Peptide and amide links are the same group chemically <ul style="list-style-type: none"> <li>• Peptide links are found in proteins</li> <li>• Amide links are found in polyamide polymers e.g. nylon, kevlar</li> </ul> <div style="text-align: center;"> <math display="block">\begin{array}{c} \text{O} \quad \text{H} \\    \quad   \\ -\text{C}-\text{N}- \end{array}</math> </div>																	
29	B	85	A catalyst lowers the activation energy of both the forward and reverse reactions. This increases the rates of the forward and reverse reactions. The catalyst allows equilibrium to be established more quickly. The final concentrations of reactants and products remains the same as the position of equilibrium remains unchanged.																	
30	C	29	The red colour will fade as equilibrium shifts to right. <input checked="" type="checkbox"/> A Equilibrium shifts to left as product ( $\text{H}^+$ ) is added to equilibrium <input checked="" type="checkbox"/> B Equilibrium shifts to left as product ( $\text{Br}^-$ ) is added to equilibrium <input checked="" type="checkbox"/> C Equilibrium shifts to right as product ( $\text{Br}^-$ ) is removed by $\text{Ag}^+\text{Br}^-_{(s)}$ precipitation <input checked="" type="checkbox"/> D Equilibrium shifts to left as product ( $\text{OBr}^-$ ) is added to equilibrium																	
31	B	71	<input checked="" type="checkbox"/> A nitric acid is a strong acid <input checked="" type="checkbox"/> B $0.1\text{mol l}^{-1}$ solution is a dilute solution and nitric acid is strong acid <input checked="" type="checkbox"/> C $0.1\text{mol l}^{-1}$ solution is a dilute solution <input checked="" type="checkbox"/> D $0.1\text{mol l}^{-1}$ solution is a dilute solution																	
32	B	53	<input checked="" type="checkbox"/> A polar molecules are covalent molecules so do not conduct electricity <input checked="" type="checkbox"/> B little dissociation of $\text{H}_2\text{O} \rightarrow \text{H}^+ + \text{OH}^-$ : few ions means small conductivity <input checked="" type="checkbox"/> C hydrogen bonding is between non-conducting molecules <input checked="" type="checkbox"/> D the low conductivity of water is not dependent on equal numbers of $\text{H}^+$ and $\text{OH}^-$																	
33	C	72	<input checked="" type="checkbox"/> A ammonia solution is a weak alkali and has $\text{pH} > 7$ <input checked="" type="checkbox"/> B ammonia solution is a weak alkali and only partially ionised (dissociated) <input checked="" type="checkbox"/> C ammonia solution is an alkali so it contains more $\text{OH}^-$ ions than $\text{H}^+$ ions <input checked="" type="checkbox"/> D In neutralisation reactions with acids, ammonia solution forms ammonium salts																	
34	A	78	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <thead> <tr> <th>Acid</th> <th>Type</th> <th>pH</th> <th>Conductivity</th> <th>Rate of Reaction With Magnesium</th> <th>Volume of Alkali neutralised</th> </tr> </thead> <tbody> <tr> <td>Hydrochloric acid</td> <td>Strong</td> <td>lower (e.g. <math>\text{pH}=0</math>)</td> <td>High</td> <td>Fast</td> <td rowspan="2">same</td> </tr> <tr> <td>Ethanoic acid</td> <td>Weak</td> <td>higher (e.g. <math>\text{pH}=4</math>)</td> <td>Low</td> <td>Slow</td> </tr> </tbody> </table>	Acid	Type	pH	Conductivity	Rate of Reaction With Magnesium	Volume of Alkali neutralised	Hydrochloric acid	Strong	lower (e.g. $\text{pH}=0$ )	High	Fast	same	Ethanoic acid	Weak	higher (e.g. $\text{pH}=4$ )	Low	Slow

# 2008 Higher Chemistry Marking Scheme

Long Qu	Answer	Reasoning																		
1	<table border="1"> <tr> <td>Molecular covalent</td> </tr> <tr> <td>Covalent network</td> </tr> </table>	Molecular covalent	Covalent network	<p>Both carbon dioxide and silicon dioxide are covalent substances containing only non-metals. Compounds containing only non-metals are covalent and do not conduct in any state.</p> <ul style="list-style-type: none"> <li>• <math>\text{CO}_2</math> is a gas at room temperature indicating it has discrete covalent molecules</li> <li>• <math>\text{SiO}_2</math> is a solid with a really high melting point indicating it is a covalent network.</li> </ul>																
Molecular covalent																				
Covalent network																				
2a	Esters	Each fat/oil molecule has three ester bonds between the alcohol glycerol and the three fatty acids																		
2b	Hydrogen added across $\text{C}=\text{C}$ double bond	Oils have $\text{C}=\text{C}$ double bonds which makes the carbon chain bent and this keeps the molecules far enough apart to ensure the oil is a liquid at room temperature. When hydrogen is added across the $\text{C}=\text{C}$ double bond, the molecule straightens, which means they fit together more closely and makes the fat a solid at room temperature																		
2c	Oils provide energy	Oils are more healthy for you in your diet as they lower cholesterol etc.																		
3a	Volume of KI and volume of $\text{H}_2\text{O}$ always adds up to $25\text{cm}^3$	<p>The concentration of potassium iodide (KI) is altered by decreasing the volume of KI from <math>25\text{cm}^3</math> by <math>5\text{cm}^3</math> at the same time as the water volume is increased by <math>5\text{cm}^3</math></p> <table border="1"> <tr> <td>Volume of KI (<math>\text{cm}^3</math>)</td> <td>25</td> <td>20</td> <td>15</td> <td>10</td> <td>5</td> </tr> <tr> <td>Volume of water (<math>\text{cm}^3</math>)</td> <td>0</td> <td>5</td> <td>10</td> <td>15</td> <td>20</td> </tr> <tr> <td>Total Volume of liquid (<math>\text{cm}^3</math>)</td> <td>25</td> <td>25</td> <td>25</td> <td>25</td> <td>25</td> </tr> </table>	Volume of KI ( $\text{cm}^3$ )	25	20	15	10	5	Volume of water ( $\text{cm}^3$ )	0	5	10	15	20	Total Volume of liquid ( $\text{cm}^3$ )	25	25	25	25	25
Volume of KI ( $\text{cm}^3$ )	25	20	15	10	5															
Volume of water ( $\text{cm}^3$ )	0	5	10	15	20															
Total Volume of liquid ( $\text{cm}^3$ )	25	25	25	25	25															
3b	23.3	$\text{Rate} = \frac{1}{\text{time}} \therefore \text{time} = \frac{1}{\text{rate}} = \frac{1}{0.043} = 23.3\text{s}$																		
4a	Synthesis gas	<p>Synthesis gas is a mixture of carbon monoxide and hydrogen. It is made by:</p> <table border="1"> <tr> <td>Steam reforming of methane</td> <td>Steam reforming of coal</td> </tr> <tr> <td><math>\text{CH}_4 + \text{H}_2\text{O} \rightarrow \text{CO} + 3\text{H}_2</math></td> <td><math>\text{C} + \text{H}_2\text{O} \rightarrow \text{CO} + \text{H}_2</math></td> </tr> </table>	Steam reforming of methane	Steam reforming of coal	$\text{CH}_4 + \text{H}_2\text{O} \rightarrow \text{CO} + 3\text{H}_2$	$\text{C} + \text{H}_2\text{O} \rightarrow \text{CO} + \text{H}_2$														
Steam reforming of methane	Steam reforming of coal																			
$\text{CH}_4 + \text{H}_2\text{O} \rightarrow \text{CO} + 3\text{H}_2$	$\text{C} + \text{H}_2\text{O} \rightarrow \text{CO} + \text{H}_2$																			
4b	$\text{CH}_3\text{CH}(\text{CH}_3)\text{CHO}$ or 	<h2 style="text-align: center;">2-methylpropanal</h2> <div style="display: flex; justify-content: space-around; font-size: small;"> <div style="text-align: center;">methyl -<math>\text{CH}_3</math> group on <math>\text{C}_2</math></div> <div style="text-align: center;">3 carbons on main chain with single bonds</div> <div style="text-align: center;">aldehyde -<math>\text{CHO}</math> group on <math>\text{C}_1</math></div> </div>

Oxidising agent	Start Colour	End Colour																		
Acidified Dichromate	Orange	Green																		
Benedict's/Fehling's	Blue	Brick Red (orange)																		
Hot copper (II) oxide	Black	Brown																		
Tollen's Reagent	(Colourless)	Silver mirror produced																		
4c(ii)	In a hot water bath	As reactants are flammable a naked flame e.g. Bunsen burner must not be used for safety reasons																		
4d	Primary	<table border="1"> <tr> <td rowspan="3" style="vertical-align: middle;">Oxidation of alcohols</td> <td>Primary Alcohol</td> <td><math>\longrightarrow</math></td> <td>Aldehyde</td> <td><math>\longrightarrow</math></td> <td>Carboxylic Acid</td> </tr> <tr> <td>Secondary Alcohol</td> <td><math>\longrightarrow</math></td> <td>Ketone</td> <td><math>\longrightarrow</math></td> <td>[No oxidation]</td> </tr> <tr> <td>Tertiary Alcohol</td> <td><math>\longrightarrow</math></td> <td>X</td> <td><math>\longrightarrow</math></td> <td>[No oxidation]</td> </tr> </table>	Oxidation of alcohols	Primary Alcohol	$\longrightarrow$	Aldehyde	$\longrightarrow$	Carboxylic Acid	Secondary Alcohol	$\longrightarrow$	Ketone	$\longrightarrow$	[No oxidation]	Tertiary Alcohol	$\longrightarrow$	X	$\longrightarrow$	[No oxidation]		
Oxidation of alcohols	Primary Alcohol	$\longrightarrow$		Aldehyde	$\longrightarrow$	Carboxylic Acid														
	Secondary Alcohol	$\longrightarrow$		Ketone	$\longrightarrow$	[No oxidation]														
	Tertiary Alcohol	$\longrightarrow$	X	$\longrightarrow$	[No oxidation]															
5a	Beta Particle or $\beta$	${}_{42}^{99}\text{Mo} \rightarrow {}_{43}^{99}\text{Tc} + {}_{-1}^0\text{e}$																		
5b(i)	Curve with points:	<table border="1"> <tr> <td>Time (hours)</td> <td>0</td> <td>6</td> <td>12</td> <td>18</td> <td>24</td> </tr> <tr> <td>Mass (g)</td> <td>0.5</td> <td>0.25</td> <td>0.125</td> <td>0.06</td> <td>0.003</td> </tr> </table>	Time (hours)	0	6	12	18	24	Mass (g)	0.5	0.25	0.125	0.06	0.003						
Time (hours)	0	6	12	18	24															
Mass (g)	0.5	0.25	0.125	0.06	0.003															
5b(ii)	Short half-life	The half life of isotope is short enough that it does last in the body for very long.																		
6a(i)	Benzene does not decolourise bromine	Benzene does not decolourise bromine solution rapidly as benzene has no $\text{C}=\text{C}$ double bonds																		
6a(ii)	Ring of 6 carbons with 6 delocalised electrons	Benzene is a flat planar molecule with six carbons in a ring with a bond angle of $120^\circ\text{C}$ and equal bond lengths. Each carbon has one unbonded electron which ends up in a delocalised ring of electrons.																		

10a	Arrow pointing to level point of graph	At equilibrium, the concentrations of reactants and products are equal. This is indicated on the graph by levelling off horizontally										
10b	Same number of moles of gas on either side of arrow	The equation has 1 mole of gas on both the reactant side and the product side of the equation. Changing the pressure in this reaction has no effect on the equilibrium as neither the forward nor reverse reaction can change the pressure of the reaction.										
10c	Graph showing propene and cyclopropane reaching same final concentrations as part a	The final concentrations of products and reactants at equilibrium is the same regardless of the starting concentrations of reactants/products.										
11a	Answer to include:	Alkalis contain the OH <sup>-</sup> hydroxide ion. Alcohols contain the -OH hydroxyl functional group but alcohols do not form OH <sup>-</sup> ions in water ∴ alcohols are neutral										
11b	Answer to include:	Iodine reacts with starch and turns blue/black. Potassium iodide contains iodide I <sup>-</sup> ions not iodine. Iodide ions do not react with starch.										
12a	Enzymes have a specific shape to fit reactant only	Enzymes are globular proteins which have a specific shape which fits a substrate exactly like a key in a lock. The enzyme will then catalyse the chemical reaction. Enzymes are very sensitive to changes in temperature and pH which change the shape of the enzyme.

13b(ii)	The reactants are turned into products. When the products are all used up for its purpose, fresh products are made	A batch process is for smaller quantities of products e.g. medicines. The process is cheaper because huge quantities are not required. A continuous process is for large quantities of chemicals e.g. fertilisers. The process is expensive to set up but is cheaper in the long run due to the larger quantities.
