2010 Higher Chemistry Marking Scheme

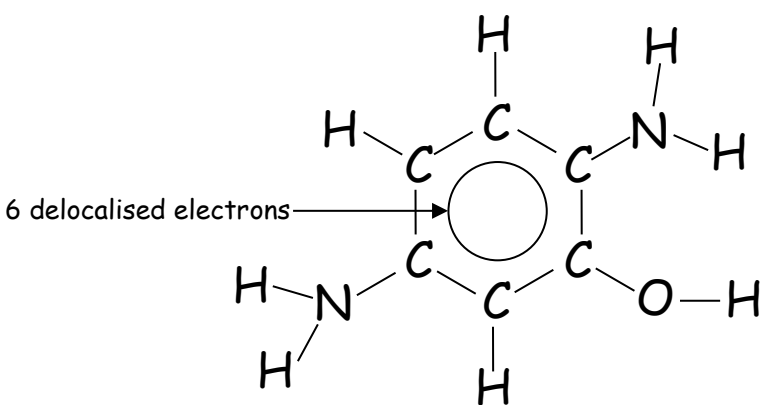

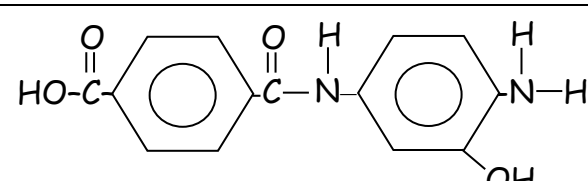

MC Qu	Answer	% Pupils Correct	Reasoning
1	B	80	<input checked="" type="checkbox"/> A HBr would dissolve to form hydrobromic acid solution with $\text{pH} < 7$ <input checked="" type="checkbox"/> B NH_3 would dissolve to form ammonium hydroxide solution with $\text{pH} > 7$ <input checked="" type="checkbox"/> C CO_2 would dissolve to form carbonic acid solution with $\text{pH} < 7$ <input checked="" type="checkbox"/> D CH_4 is a non-polar hydrocarbon and does not dissolve.
2	C	74	<input checked="" type="checkbox"/> A No precipitate as magnesium chloride or sodium nitrate are both soluble <input checked="" type="checkbox"/> B No precipitate as magnesium sulphate or sodium nitrate are both soluble <input checked="" type="checkbox"/> C Precipitate formed: Silver chloride is insoluble and forms a precipitate <input checked="" type="checkbox"/> D No precipitate as silver sulphate or sodium nitrate are both soluble
3	C	35	1mol of CuCl_2 formula units \leftrightarrow 1mol Cu^{2+} ions 1mol of CuSO_4 formula units \leftrightarrow 1mol Cu^{2+} ions \therefore 0.5mol CuCl_2 f.u. \leftrightarrow 0.5mol Cu^{2+} ions \therefore 0.5mol CuSO_4 f.u. \leftrightarrow 0.5mol Cu^{2+} ions Total number of Cu^{2+} ions = 0.5mol + 0.5mol = 1mol $\text{concentration} = \frac{\text{no. of mol}}{\text{volume}} = \frac{1 \text{ mol}}{0.5 \text{ litres}} = 2 \text{ mol l}^{-1}$
4	B	67	<input checked="" type="checkbox"/> A Temperature is a measure of the kinetic energy of all particles not just the ones which react <input checked="" type="checkbox"/> B Temperature is a measure of the kinetic energy of all particles not just the ones which react <input checked="" type="checkbox"/> C The activation energy is the minimum energy required for a successful collision <input checked="" type="checkbox"/> D The activation energy is the minimum energy required for a successful collision
5	B	43	0.8mol of H_2 remaining \therefore 0.2mol of H_2 has reacted $\begin{array}{ccc} \text{H}_2 + \text{I}_2 & \longrightarrow & 2\text{HI} \\ 1\text{mol} & & 2\text{mol} \\ 0.2\text{mol} & & 0.4\text{mol} \end{array}$
6	D	26	<input checked="" type="checkbox"/> A Increasing the concentration would increase the final volume of gas produced <input checked="" type="checkbox"/> B H_2SO_4 has 2xH^+ ions per formula unit so final volume of gas produced would increase <input checked="" type="checkbox"/> C Ethanoic acid is a weak acid so initial gradient would be less steep <input checked="" type="checkbox"/> D Magnesium is more reactive than zinc so initial gradient of line is steeper
7	C	59	<input checked="" type="checkbox"/> A True: a catalyst provides an alternative route to the products <input checked="" type="checkbox"/> B True: a catalyst lowers the energy needed for successful collisions (activation energy) <input checked="" type="checkbox"/> C False: a catalyst does not provide any energy to a reaction <input checked="" type="checkbox"/> D False: reactant molecules adsorb to the catalyst but do not form strong bonds
8	B	62	The activation energy (E_a) is the minimum energy required for a successful collision and the formation of products. The value of the activation energy is always endothermic (positive) as it represents the bond breaking processes. The enthalpy change (ΔH) cannot be higher than the activation energy because it represents both endothermic bond breaking steps and exothermic bond forming steps.
9	A	82	<input checked="" type="checkbox"/> A the boiling point increases down group 7 (data booklet p4) <input checked="" type="checkbox"/> B the density increases down group 7 (data booklet p3) <input checked="" type="checkbox"/> C the 1 st ionisation decreases down group 7 (data booklet p10) <input checked="" type="checkbox"/> D the atomic size increases down group 7 (data booklet p5)
10	D	39	$\begin{array}{lll} \text{2}^{\text{nd}} \text{ ionisation energy: } & \text{①} & \text{Al}^+(\text{g}) \rightarrow \text{Al}^{2+}(\text{g}) + \text{e}^- \quad \Delta H = +1830\text{kJ mol}^{-1} \\ \text{3}^{\text{rd}} \text{ ionisation energy: } & \text{②} & \text{Al}^{2+}(\text{g}) \rightarrow \text{Al}^{3+}(\text{g}) + \text{e}^- \quad \Delta H = +2760\text{kJ mol}^{-1} \\ & & \text{①x-1} \quad \text{Al}^{2+}(\text{g}) + \text{e}^- \rightarrow \text{Al}^+(\text{g}) \quad \Delta H = -1830\text{kJ mol}^{-1} \\ & & \text{②x-1} \quad \text{Al}^{3+}(\text{g}) + \text{e}^- \rightarrow \text{Al}^{2+}(\text{g}) \quad \Delta H = -2760\text{kJ mol}^{-1} \\ & & \text{①'+②'} \quad \text{Al}^{3+}(\text{g}) + 2\text{e}^- \rightarrow \text{Al}^+(\text{g}) \quad \Delta H = -4590\text{kJ mol}^{-1} \end{array}$
11	B	79	<input checked="" type="checkbox"/> A atoms of similar size can have different electronegativities affecting polarity <input checked="" type="checkbox"/> B atoms with same electronegativity form non-polar covalent bonds <input checked="" type="checkbox"/> C 1 st ionisation energy has no effect on polarity of a bond <input checked="" type="checkbox"/> D atoms with different number of outer electrons can form non-polar covalent bonds
12	A	72	<input checked="" type="checkbox"/> A CH_3COOH has an O-H bond \therefore ethanoic acid contains hydrogen bonding <input checked="" type="checkbox"/> B Ethyl ethanoate ($\text{C}_2\text{H}_5\text{COOCH}_3$) does not have a N,O or F atom bonded to a hydrogen <input checked="" type="checkbox"/> C Hexane C_6H_{14} does not have a N,O or F atom bonded to a hydrogen atom <input checked="" type="checkbox"/> D Hex-1-ene C_6H_{12} does not have a N,O or F atom bonded to a hydrogen atom

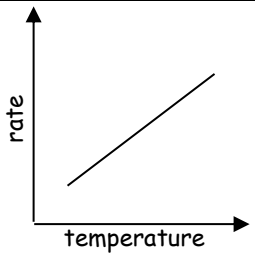

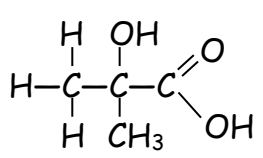

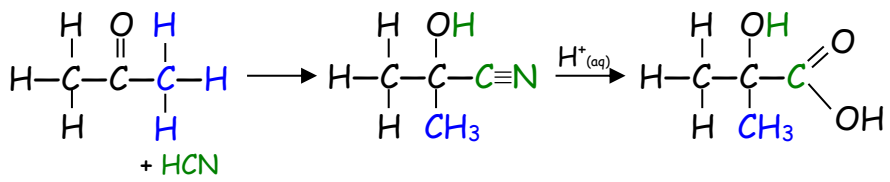

13	B	54	<p>The C-F bond is POLAR due to electronegativity difference of 1.5</p> $\begin{array}{c} \delta^+ \quad \delta^- \\ \text{C} - \text{F} \end{array}$ <p>Tetrafluoroethene has a planar (flat) arrangement of atoms and polarity of bonds should look like:</p> $\begin{array}{c} \delta^- \quad \delta^+ \quad \delta^- \\ \text{F} \quad \text{C} = \text{C} \quad \text{F} \\ \delta^- \quad \delta^+ \quad \delta^- \\ \text{F} \quad \text{F} \end{array}$ <p>To be a polar molecule, molecule must have a positive end and a negative end. This molecule would only have negative ends so polarity cancels out and the molecule is NON-POLAR</p> $\begin{array}{c} \text{F} \quad \text{F} \\ \diagdown \quad \diagup \\ \text{C} = \text{C} \\ \diagup \quad \diagdown \\ \text{F} \quad \text{F} \end{array}$										
14	D	67	<input checked="" type="checkbox"/> A magnesium oxide is ionic and is a solid at room temperature <input checked="" type="checkbox"/> B silicon dioxide is covalent network and is a solid at room temperature <input checked="" type="checkbox"/> C nitrogen is a gas at room temperature <input checked="" type="checkbox"/> D sulphur is a solid at room temp, doesn't conduct as a solid and forms SO _{2(g)}										
15	D	62	<input checked="" type="checkbox"/> A gfm O ₂ molecules = 32g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{16}{32} = 0.5\text{mol O}_2$ molecules <input checked="" type="checkbox"/> B no. of mol = $v \times c = 1 \times 1 = 1\text{mol} \therefore 1\text{mol Na}^+\text{Cl}^-$ formula units ∴ 2 mol of ions <input checked="" type="checkbox"/> C gfm C atoms = 12g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{24}{12} = 2\text{mol C}$ atoms <input checked="" type="checkbox"/> D gfm H ₂ molecules = 2g ∴ no. of mol = $\frac{\text{mass}}{\text{gfm}} = \frac{2}{2} = 1\text{mol H}_2$ molecules										
16	C	34	<input checked="" type="checkbox"/> A ¹ H does not have any neutrons <input checked="" type="checkbox"/> B 1mol ¹² C = 12g ∴ 1g = $\frac{1}{12}\text{mol}$ but 6 neutrons per ¹² C ∴ $\frac{6}{12}\text{mol neutrons} = 0.5\text{mol}$ <input checked="" type="checkbox"/> C 1mol ²⁴ Mg = 24g ∴ 2g = $\frac{2}{24}\text{mol}$ but 12 neutrons per ²⁴ Mg ∴ $\frac{24}{24}\text{mol neutrons} = 1\text{mol}$ <input checked="" type="checkbox"/> D 1mol ²² Ne = 22g ∴ 2g = $\frac{2}{22}\text{mol}$ but 12 neutrons per ²² Ne ∴ $\frac{24}{22}\text{mol neutrons} = 1.09\text{mol}$										
17	D	48	$\begin{array}{ccccccc} 3\text{CuO(s)} & + & 2\text{NH}_3(\text{g}) & \longrightarrow & 3\text{Cu(s)} & + & 3\text{H}_2\text{O(g)} & + & \text{N}_2(\text{g}) \\ 3\text{mol} & & 2\text{mol} & & 3\text{mol} & & 3\text{mol} & & 1\text{mol} \\ \text{negligible vol} & & 2\text{vol} & & \text{negligible vol} & & 3\text{vol} & & 1\text{vol} \\ & & 20\text{cm}^3 & & & & 30\text{cm}^3 & & 10\text{cm}^3 \end{array}$										
18	A	84	Biological material breaks down by anaerobic respiration in a landfill rubbish dump when there is no oxygen available for aerobic respiration by bacteria. Biogas contains mainly methane gas as this small carbon molecule is produced instead of carbon dioxide.										
19	A	89	<input checked="" type="checkbox"/> A 2 carbons on the alcohol side (ethanol) and 4 carbons on the C=O side (butanoic acid) <input checked="" type="checkbox"/> B The C=O side of the ester contains 4 carbons ∴ ester made from butanoic acid <input checked="" type="checkbox"/> C The C=O side of the ester contains 4 carbons ∴ ester made from butanoic acid <input checked="" type="checkbox"/> D The C=O side of the ester contains 4 carbons ∴ ester made from butanoic acid										
20	B	87	<input checked="" type="checkbox"/> A Primary: 1 carbon directly attached to the carbon with the -OH group <input checked="" type="checkbox"/> B Tertiary: 3 carbons directly attached to the carbon with the -OH group <input checked="" type="checkbox"/> C Secondary: 2 carbons directly attached to the carbon with the -OH group <input checked="" type="checkbox"/> D Secondary: 2 carbons directly attached to the carbon with the -OH group										
21	C	84	<input checked="" type="checkbox"/> A chlorines add onto adjacent carbons not onto the same carbon <input checked="" type="checkbox"/> B chlorines add onto adjacent carbons not onto the same carbon <input checked="" type="checkbox"/> C ethyne + chlorine → 1,2-dichloroethene <input checked="" type="checkbox"/> D 1mol of chlorine will react C≡C triple bond in ethyne to become C=C double bond

5a(i)	Volume of reactant(s) Concentration of reactant(s)	PPA 1.2 Question										

5a(ii)	Colour change is too gradual at room temp	PPA 1.2 Question										
5b		The rate of a reaction increases with increasing temperature										
6a	Equation showing:	${}^6_{11}\text{C} \rightarrow {}^5_{11}\text{B} + {}^{+1}_0\text{e}$										
6b	20	<table border="1" data-bbox="710 548 1332 638"> <tbody> <tr> <td>Rate</td> <td>640</td> <td>320</td> <td>160</td> <td>80</td> </tr> <tr> <td>No of $t_{\frac{1}{2}}$</td> <td>0</td> <td>1</td> <td>2</td> <td>3</td> </tr> </tbody> </table> $3 \times t_{\frac{1}{2}} = 60 \text{ min} \therefore t_{\frac{1}{2}} = 60/3 = 20 \text{ min}$	Rate	640	320	160	80	No of $t_{\frac{1}{2}}$	0	1	2	3
Rate	640	320	160	80								
No of $t_{\frac{1}{2}}$	0	1	2	3								
6c	Pure ${}^{11}\text{C}$ contains more ${}^{11}\text{C}$ nuclei than same mass of glucose containing ${}^{11}\text{C}$ atoms	The half life of ${}^{11}\text{C}$ is the same regardless of temperature and chemical form (element, compound or ion). The half-life of the ${}^{11}\text{C}$ nucleus is constant. The intensity of the radiation depends on the number of ${}^{11}\text{C}$ nuclei present. Pure ${}^{11}\text{C}$ contains more nuclei than the same mass of a compound containing ${}^{11}\text{C}$ nuclei.										
7a	Answer to include:	<p>$\text{C}\equiv\text{N}$ bond has electronegativity difference of 0.5</p> <p>Electrons between C and N are unequally shared between atoms</p> <p>Permanent dipoles ($\delta+$ and $\delta-$) are set up</p> <p>Molecules closer together due to electrostatic attraction between $\delta+$ and $\delta-$</p>										
7b												
8a(i)	Chemical used to make another chemical	<p>A feedstock is a chemical used to make another chemical.</p> <p>A raw material is a substance found naturally on Earth needed by the chemical industry for a particular chemical reaction.</p>										
8a(ii)	Addition	An addition reaction has taken place as Cl-OH has been added across the C=C double bond										
8a(iii)	Sodium chloride	<p>Sodium Na^+ from NaOH transfers into the salt</p> <p>Chlorine from molecule transfer into the salt as chloride Cl^- ion</p>										
8a(iv)	Fats/Oils are a renewable resource	<p>Fats and Oils are a renewable resource as they are made using CO_2 recently converted into biomolecules like fats and oils.</p> <p>Propene is made from fossil fuels therefore the glycerol would effectively be made from CO_2 from millions of years ago. When this glycerol is returned to CO_2, the CO_2 contributes to the greenhouse effect as it is additional CO_2.</p>										
8b	$2\text{C}_3\text{H}_8\text{O}_3$ \downarrow $3\text{CO}_2 + 3\text{CH}_4 + 2\text{H}_2$	$2\text{C}_3\text{H}_8\text{O}_3 \longrightarrow 3\text{CO}_2 + 3\text{CH}_4 + 2\text{H}_2$
