		Carbohydrate	fructose	glucose	maltose	sucrose	starch																							
		Reaction with Benedict's Solution	turns brick red	turns brick red	turns brick red	no change	no change																							
		Reaction with Iodine Solution	no change	no change	no change	no change	turns blue/black																							
3a	A	<input checked="" type="checkbox"/> A monomer is a butene which polymerises to form poly(butene) <input checked="" type="checkbox"/> B structure lacks C=C double bond so cannot polymerises into a polymer <input checked="" type="checkbox"/> C structure lacks C=C double bond so cannot polymerises into a polymer <input checked="" type="checkbox"/> D monomer is a propene which polymerises to form poly(propene)																												
		3b	D	Isomers have same formula but different structure.																										
				<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th>Answer</th> <th>A</th> <th>B</th> <th>C</th> <th>D</th> </tr> <tr> <td>Name</td> <td>but-2-ene</td> <td>propane</td> <td>butane</td> <td>propene</td> </tr> <tr> <td>Formula</td> <td><math>C_4H_8</math></td> <td><math>C_3H_8</math></td> <td><math>C_4H_{10}</math></td> <td><math>C_3H_6</math></td> </tr> </table>	Answer	A	B	C	D	Name	but-2-ene	propane	butane	propene	Formula	$C_4H_8$	$C_3H_8$	$C_4H_{10}$	$C_3H_6$											
				Answer	A	B	C	D																						
Name	but-2-ene			propane	butane	propene																								
Formula	$C_4H_8$	$C_3H_8$	$C_4H_{10}$	$C_3H_6$																										
4	A, C 1 mark each	<input checked="" type="checkbox"/> A reduction is gain of electrons: $Br + e^- \rightarrow Br^-$ <input checked="" type="checkbox"/> B changing the number of electrons does not affect the atomic number <input checked="" type="checkbox"/> C gaining electrons make atoms become negatively charged ions <input checked="" type="checkbox"/> D number of electron energy levels is unchanged <input checked="" type="checkbox"/> E bromine has an electron arrangement of 2,8,18,7 and becomes $Br^-$ with 2,8,18,8																												
		5a	D	Condensation Polymerisation: Water removed as small molecules join together. $n C_6H_{12}O_6 \longrightarrow (C_6H_{12}O_5)_n + n H_2O$ <div style="display: flex; justify-content: space-around; width: 100%;"> <span>glucose</span> <span>starch</span> <span>water</span> </div>																										
				5b	A, F 1 mark each	<input checked="" type="checkbox"/> A displacement: Higher up metal displaces a lower down metal from its solution <input checked="" type="checkbox"/> B hydrolysis: molecule splitting up with water added across the break <input checked="" type="checkbox"/> C fermentation: glucose breaking up into ethanol and carbon dioxide <input checked="" type="checkbox"/> D condensation: 2 molecules joining together and water removed where they join <input checked="" type="checkbox"/> E addition: molecule adds across a C=C double bond <input checked="" type="checkbox"/> F redox: $Fe \rightarrow Fe^{2+} + 2e^-$ (oxidation) and $Cu^{2+} + 2e^- \rightarrow Cu$ (reduction)																								

6	A, D 1 mark each	<input checked="" type="checkbox"/> A Magnesium is oxidised and loses electrons: $Mg \rightarrow Mg^{2+} + 2e^{-}$ <input checked="" type="checkbox"/> B Magnesium corrodes to protect the attached iron <input checked="" type="checkbox"/> C Iron would corrode slower attached to the more reactive magnesium <input checked="" type="checkbox"/> D Magnesium corrodes to protect the attached iron from corroding <input checked="" type="checkbox"/> E Electrons from the corroding magnesium flow to the iron
7a	B, F 1 mark each	<input checked="" type="checkbox"/> A Redox reaction: $Mg + 2HCl \rightarrow MgCl_2 + H_2$ <input checked="" type="checkbox"/> B Neutralisation reaction: $2NaOH + H_2SO_4 \rightarrow Na_2SO_4 + 2H_2O$ <input checked="" type="checkbox"/> C No Reaction: Copper not reactive enough to react with dilute acids <input checked="" type="checkbox"/> D Displacement/Redox Reaction: $Zn + 2AgNO_3 \rightarrow Zn(NO_3)_2 + 2Ag$ <input checked="" type="checkbox"/> E Precipitation reaction: $CuSO_4(aq) + Na_2CO_3(aq) \rightarrow Na_2SO_4(aq) + CuCO_3(s)$ <input checked="" type="checkbox"/> F Neutralisation reaction: $CaCO_3 + 2HCl \rightarrow CaCl_2 + H_2O + CO_2$
7b	C	copper metal is below hydrogen in electrochemical series and will not react with dilute acids.
8a	D	<input checked="" type="checkbox"/> A $(H^+)_2SO_4^{2-}$ contains two $H^+$ ions but only one $SO_4^{2-}$ ion per formula unit <input checked="" type="checkbox"/> B barium hydroxide and hydrochloric acid produces no precipitate ( $BaCl_2$ is soluble) <input checked="" type="checkbox"/> C $H^+$ ion concentration decreases when water is added to acid <input checked="" type="checkbox"/> D Positive $H^+$ ions move to negative electrode: $2H^+ + 2e^{-} \rightarrow H_2$ <input checked="" type="checkbox"/> E 1 mole of NaOH neutralises 0.5 mol of $H_2SO_4$ but neutralises 1 mol of HCl
8b	B, E 1 mark each	<input checked="" type="checkbox"/> A $(H^+)_2SO_4^{2-}$ contains two $H^+$ ions but only one $SO_4^{2-}$ ion per formula unit <input checked="" type="checkbox"/> B barium hydroxide + sulphuric acid gives insoluble barium sulphate precipitate. <input checked="" type="checkbox"/> C $H^+$ ion concentration decreases when water is added to any acid <input checked="" type="checkbox"/> D all acids produce hydrogen gas at the negative electrode during electrolysis <input checked="" type="checkbox"/> E 1mol of NaOH neutralises 0.5 mol of $H_2SO_4$ but neutralises 1 mol of HCl

Question	Answer	Chemistry Covered																												
9a	Low density	Low density is a desirable property to reduce the mass of the cables																												
9b	High strength	High Strength is a desirable property to ensure the cables do not break																												
10a	<table border="1"> <thead> <tr> <th>Atom</th> <th>protons</th> <th>neutrons</th> </tr> </thead> <tbody> <tr> <td><math>^{28}\text{Si}</math></td> <td>14</td> <td>14</td> </tr> <tr> <td><math>^{29}\text{Si}</math></td> <td>14</td> <td>15</td> </tr> <tr> <td><math>^{30}\text{Si}</math></td> <td>14</td> <td>16</td> </tr> </tbody> </table>	Atom	protons	neutrons	$^{28}\text{Si}$	14	14	$^{29}\text{Si}$	14	15	$^{30}\text{Si}$	14	16	<table border="1"> <thead> <tr> <th>Particle</th> <th>Location</th> <th>Charge</th> <th>Mass</th> </tr> </thead> <tbody> <tr> <td>Proton</td> <td>in nucleus</td> <td>+1</td> <td>1 amu</td> </tr> <tr> <td>Neutron</td> <td>in nucleus</td> <td>0</td> <td>1 amu</td> </tr> <tr> <td>Electron</td> <td>outside nucleus</td> <td>-1</td> <td>approx zero</td> </tr> </tbody> </table>	Particle	Location	Charge	Mass	Proton	in nucleus	+1	1 amu	Neutron	in nucleus	0	1 amu	Electron	outside nucleus	-1	approx zero
Atom	protons	neutrons																												
$^{28}\text{Si}$	14	14																												
$^{29}\text{Si}$	14	15																												
$^{30}\text{Si}$	14	16																												
Particle	Location	Charge	Mass																											
Proton	in nucleus	+1	1 amu																											
Neutron	in nucleus	0	1 amu																											
Electron	outside nucleus	-1	approx zero																											
10b	isotopes	<table border="1"> <tr> <td rowspan="2">Isotopes</td> <td>Same atomic number</td> <td>but different mass number</td> </tr> <tr> <td>Same number of protons</td> <td>but different number of neutrons</td> </tr> </table>	Isotopes	Same atomic number	but different mass number	Same number of protons	but different number of neutrons																							
Isotopes	Same atomic number	but different mass number																												
	Same number of protons	but different number of neutrons																												
10c	$^{28}\text{Si}$	Relative (average) Atomic Mass (28.11) is closest to 28 so $^{28}\text{Si}$ must be the most common isotope.																												
11a	Naphtha	Pentane boils at $36^\circ\text{C}$ (p9 of data booklet) which is within the boiling range of naphtha.																												
11b	Fraction has longer carbon chains in it.	The higher the boiling range of a fraction the longer the chains, the higher the viscosity, the lower the flammability.																												
11c(i)	Gives smaller compounds or gives unsaturated compounds	Cracking turns less useful larger fractions into smaller more useful fractions so of which are unsaturated and can be used for making plastics.																												
11c(ii)	Less energy used or lower temperature required for reaction	Catalyst speed up reactions without being used up in the reaction. A catalyst can reduce the temperature required to achieve a successful reaction (so can be safer)																												
12a	$\begin{array}{c} \text{H} \quad \text{COOCH}_3 \\   \quad   \\ \text{C}=\text{C} \\   \quad   \\ \text{H} \quad \text{CN} \end{array}$	$\begin{array}{c} \text{COOCH}_3 \quad \text{COOCH}_3 \quad \text{COOCH}_3 \\   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \\ \text{C}=\text{C} + \text{C}=\text{C} + \text{C}=\text{C} \\   \quad   \quad   \quad   \quad   \\ \text{H} \quad \text{CN} \quad \text{H} \quad \text{CN} \quad \text{H} \quad \text{CN} \end{array} \rightarrow \begin{array}{c} \text{COOCH}_3 \quad \text{COOCH}_3 \quad \text{COOCH}_3 \\   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \\ -\text{C}-\text{C}-\text{C}-\text{C}-\text{C}- \\   \quad   \quad   \quad   \quad   \\ \text{H} \quad \text{CN} \quad \text{H} \quad \text{CN} \quad \text{H} \quad \text{CN} \end{array}$																												
12b	hydrogen cyanide or carbon monoxide	Polymers with -CN groups burn to release poisonous hydrogen cyanide gas Polymers burn to form the poisonous gas carbon monoxide																												
13a	$\text{SiO}_2$	<p>Si in group 4 has valency = 4, O in group 6 has valency = 2 Use cross over rule and cancel down to achieve formula <math>\text{SiO}_2</math></p> <table border="1"> <tr> <td>Write down Valency below each ion's symbol</td> <td>Put in Cross-over Arrows</td> <td>Follow arrows and cancel down to get formula</td> </tr> <tr> <td> <math display="block">\begin{array}{cc} \text{Si} &amp; \text{O} \\ 4 &amp; 2 \end{array}</math> </td> <td> <math display="block">\begin{array}{cc} \text{Si} &amp; \text{O} \\ 4 &amp; 2 \end{array}</math> </td> <td> <math display="block">\begin{array}{c} \text{Si}_2\text{O}_4 \\ \downarrow \\ \text{SiO}_2 \end{array}</math> </td> </tr> </table>	Write down Valency below each ion's symbol	Put in Cross-over Arrows	Follow arrows and cancel down to get formula	$\begin{array}{cc} \text{Si} & \text{O} \\ 4 & 2 \end{array}$	$\begin{array}{cc} \text{Si} & \text{O} \\ 4 & 2 \end{array}$	$\begin{array}{c} \text{Si}_2\text{O}_4 \\ \downarrow \\ \text{SiO}_2 \end{array}$																						
Write down Valency below each ion's symbol	Put in Cross-over Arrows	Follow arrows and cancel down to get formula																												
$\begin{array}{cc} \text{Si} & \text{O} \\ 4 & 2 \end{array}$	$\begin{array}{cc} \text{Si} & \text{O} \\ 4 & 2 \end{array}$	$\begin{array}{c} \text{Si}_2\text{O}_4 \\ \downarrow \\ \text{SiO}_2 \end{array}$																												
13b	Chlorine $\text{Cl}_2$ gas	Problem Solving Question: $\text{Si} + 2\text{Cl}_2 \rightarrow \text{SiCl}_4$																												
13c	distillation	distillation separates liquids of different boiling points																												
13d		<p><math>\text{SiCl}_4</math> has the same tetrahedral shape of methane <math>\text{CH}_4</math></p> <ul style="list-style-type: none"> <li>• Si can substitute for carbon as they are both in group 4</li> <li>• Chlorine can substitute for hydrogen as they both have a valency of 1</li> </ul>																												
13e	$\text{SiCl}_4 + 2\text{H}_2 \rightarrow \text{Si} + 4\text{HCl}$	$\text{SiCl}_4 + 2\text{H}_2 \rightarrow \text{Si} + 4\text{HCl}$																												

14a	to complete the circuit	ions move from one beaker to the other beaker to balance movement of electrons through the wires.												
14b	any soluble tin compound	soluble tin (II) compounds examples found on p8 of data booklet: e.g. Tin (II) bromide/chloride/iodide/sulphate												
14c	Any metal below tin in electrochemical series	The further apart the metals on the electrochemical series, the greater the voltage produced												
15a	20.9%	Volume of air removed = 60.0 - 47.5 = 12.5cm <sup>3</sup> $\% \text{ Oxygen} = \frac{\text{volume removed}}{\text{total volume}} \times 100 = \frac{12.5}{60} \times 100 = 20.9\%$												
15b	to ensure all oxygen is reacted with the copper	Hot copper metal will react with oxygen to form copper oxide: $2\text{Cu}_{(s)} + \text{O}_{2(g)} \rightarrow 2\text{CuO}_{(s)}$												
15c	The oxygen removed will be replaced by the carbon dioxide produced	The syringe will move to equalise pressure inside and outside the syringe. When oxygen is removed, the pressure decreases inside the syringe and the syringe moves to equalise the pressure												
16a	To be able to identify the products or so that electrode is positive	DC (direct current) is a flow of electrons in one direction. AC (alternating current) changes direction many times in one second. This switching of direction swaps the positive and negative electrode meaning the +ve and -ve ions will not move towards one particular electrode and the circuit will not be complete.												
16b	Line graph with:	<table border="1" style="width: 100%; text-align: center;"> <tr> <td><math>\frac{1}{2}</math> mark both labels with units</td> <td><math>\frac{1}{2}</math> mark both scales</td> <td><math>\frac{1}{2}</math> mark points plotted correctly</td> <td><math>\frac{1}{2}</math> mark points joined</td> </tr> </table>	$\frac{1}{2}$ mark both labels with units	$\frac{1}{2}$ mark both scales	$\frac{1}{2}$ mark points plotted correctly	$\frac{1}{2}$ mark points joined								
$\frac{1}{2}$ mark both labels with units	$\frac{1}{2}$ mark both scales	$\frac{1}{2}$ mark points plotted correctly	$\frac{1}{2}$ mark points joined											
16c	~ 17cm <sup>3</sup> (from graph)	On graph, find 10 on x-axis and find the point on graph directly above 10min. AT this point, move horizontally to find the value on the y-axis for volume of gas in cm <sup>3</sup>												
16d	$2\text{H}^+ + 2\text{e}^- \rightarrow \text{H}_2$	equation found on p10 of data booklet												
17a	Haber Process	Nitrogen + Hydrogen $\xrightarrow{\text{iron}}$ Ammonia												
17b	Ammonia breaks down or yield decreases	The Haber Process does not give 100% ammonia as it starts to break down as fast as it is produced. The higher the temperature the less ammonia is produced.												
17c	Ammonia used to make fertilisers and fertilisers need to feed increased population	Ammonia is used to make nitric acid in the Ostwald process and then produces nitrate fertilisers. More population means more food required to feed larger population.												
18a	family of compounds with similar chemical properties and a general formula	<table border="1" style="width: 100%; text-align: center;"> <tr> <td>Homologous Series</td> <td>Alkane</td> <td>Alkene</td> <td>Cycloalkane</td> <td>Alcohol</td> <td>Carboxylic Acids</td> </tr> <tr> <td>General Formula</td> <td><math>\text{C}_n\text{H}_{2n+2}</math></td> <td><math>\text{C}_n\text{H}_{2n}</math></td> <td><math>\text{C}_n\text{H}_{2n}</math></td> <td><math>\text{C}_n\text{H}_{2n+1}\text{OH}</math></td> <td><math>\text{C}_n\text{H}_{2n+1}\text{COOH}</math></td> </tr> </table>	Homologous Series	Alkane	Alkene	Cycloalkane	Alcohol	Carboxylic Acids	General Formula	$\text{C}_n\text{H}_{2n+2}$	$\text{C}_n\text{H}_{2n}$	$\text{C}_n\text{H}_{2n}$	$\text{C}_n\text{H}_{2n+1}\text{OH}$	$\text{C}_n\text{H}_{2n+1}\text{COOH}$
Homologous Series	Alkane	Alkene	Cycloalkane	Alcohol	Carboxylic Acids									
General Formula	$\text{C}_n\text{H}_{2n+2}$	$\text{C}_n\text{H}_{2n}$	$\text{C}_n\text{H}_{2n}$	$\text{C}_n\text{H}_{2n+1}\text{OH}$	$\text{C}_n\text{H}_{2n+1}\text{COOH}$									
18b	36g	$1\text{mol C}_3\text{H}_8 = (3 \times 12) + (8 \times 1) = 36 + 8 = 44\text{g}$ $\text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{22\text{g}}{44\text{g mol}^{-1}} = 0.5\text{mol}$ $\text{C}_3\text{H}_8 + 5\text{O}_2 \rightarrow 3\text{CO}_2 + 4\text{H}_2\text{O}$ <div style="display: flex; justify-content: space-around; width: 100%;"> <div style="text-align: center;">1mol 0.5mol</div> <div style="text-align: center;">4mol 2mol</div> </div> $1\text{mol H}_2\text{O} = (2 \times 1) + (1 \times 16) = 2 + 16 = 18\text{g}$ $\text{mass} = \text{no. of mol} \times \text{gfm} = 2\text{mol} \times 18\text{g mol}^{-1} = 36\text{g}$												
19a	Water in test tube would not turn iodine blue/black	Starch molecules are too big to fit through the small holes in the visking tube. Any starch getting through holes would turn the water in the test tube blue/black.												
19b(i)	Breaking down adding water at the breaks	Hydrolysis: $\text{starch} + \text{water} \rightarrow \text{glucose}$ $(\text{C}_6\text{H}_{10}\text{O}_5)_n + n\text{H}_2\text{O} \rightarrow n\text{C}_6\text{H}_{12}\text{O}_6$												

19b(ii)	Answer to include:	<ol style="list-style-type: none"> <li>1. Starch and amylase solution mixed and placed into Visking tubing.</li> <li>2. Visking tubing tied at end and washed on outside.</li> <li>3. Visking tubing placed in test tube of water and incubated at 37°C in water bath</li> <li>4. After some time, water outside Visking tubing is tested with warm Benedict's solution. When it turns brick red it indicated glucose and has travelled through the visking tubing.</li> </ol>																								
20a	Fermentation	$\text{glucose} \xrightarrow[\text{(no air)}]{\text{yeast enzymes}} \text{ethanol} + \text{carbon dioxide}$ $C_6H_{12}O_6 \longrightarrow 2C_2H_5OH + 2CO_2$																								
20b(i)	higher the no. of carbons, the higher the amount of heat released	Increased number of carbons methanol → butanol gradual increase in the amount of heat energy increased																								
20b(ii)	~3311 kJ	<table border="1"> <thead> <tr> <th>Alkanol</th> <th>Methanol</th> <th>Ethanol</th> <th>Propanol</th> <th>Butanol</th> <th>Pentanol</th> </tr> </thead> <tbody> <tr> <td>Heat Released (kJ)</td> <td>726</td> <td>1367</td> <td>2017</td> <td>2665</td> <td>-</td> </tr> <tr> <td>Difference:</td> <td></td> <td>641</td> <td>650</td> <td>648</td> <td>Average 646</td> </tr> <tr> <td>Prediction:</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> <td>3311</td> </tr> </tbody> </table>	Alkanol	Methanol	Ethanol	Propanol	Butanol	Pentanol	Heat Released (kJ)	726	1367	2017	2665	-	Difference:		641	650	648	Average 646	Prediction:	-	-	-	-	3311
