2009 Standard Grade Chemistry General Marking Scheme

Question	Answer	Chemistry Covered														
1a	B	Fluorine has the electron arrangement of 2,7 (p6 data booklet)														
1b	E	Noble Gases are unreactive elements, found in Group 0														
1c	C+D <small>Both for 1 mark</small>	Groups are vertical columns on the periodic table														
2a	D	Iron is the catalyst in the Haber Process: $N_2 + 3H_2 \rightarrow 2NH_3$														
2b	A	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 10%;">Metal</td> <td style="width: 15%;">Mercury</td> <td style="width: 15%;">Magnesium</td> <td style="width: 15%;">Copper</td> <td style="width: 15%;">iron</td> <td style="width: 15%;">silver</td> <td style="width: 15%;">sodium</td> </tr> <tr> <td>Density</td> <td>13.5</td> <td>1.74</td> <td>8.96</td> <td>7.87</td> <td>10.5</td> <td>0.97</td> </tr> </table>	Metal	Mercury	Magnesium	Copper	iron	silver	sodium	Density	13.5	1.74	8.96	7.87	10.5	0.97
Metal	Mercury	Magnesium	Copper	iron	silver	sodium										
Density	13.5	1.74	8.96	7.87	10.5	0.97										
2c	F	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 10%;">Metal</td> <td style="width: 15%;">Mercury</td> <td style="width: 15%;">Magnesium</td> <td style="width: 15%;">Copper</td> <td style="width: 15%;">iron</td> <td style="width: 15%;">silver</td> <td style="width: 15%;">sodium</td> </tr> <tr> <td>Discovery</td> <td>ancient</td> <td>1774 <small>(old data booklet)</small></td> <td>ancient</td> <td>ancient</td> <td>ancient</td> <td>1807</td> </tr> </table>	Metal	Mercury	Magnesium	Copper	iron	silver	sodium	Discovery	ancient	1774 <small>(old data booklet)</small>	ancient	ancient	ancient	1807
Metal	Mercury	Magnesium	Copper	iron	silver	sodium										
Discovery	ancient	1774 <small>(old data booklet)</small>	ancient	ancient	ancient	1807										
3a	B+F <small>Both for 1 mark</small>	Variable which is changing: concentration (B is 1 mol/l and F is 2mol/l) Variables remaining the same: particle size (ribbon) and temperature (20°C)														
3b	E	Box E is the fastest reaction: lowest particle size (powder), highest concentration (2mol/l) highest temperature (40°C)														
4a	C	Air contains approx 80% nitrogen and approx 20% oxygen														
4b	B	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 25%;">Gas</td> <td style="width: 25%;">Hydrogen</td> <td style="width: 25%;">Oxygen</td> <td style="width: 25%;">Carbon Dioxide</td> </tr> <tr> <td>Gas Test</td> <td>Burns with a pop</td> <td>Relights glowing splint</td> <td>Turns lime water milky</td> </tr> </table>	Gas	Hydrogen	Oxygen	Carbon Dioxide	Gas Test	Burns with a pop	Relights glowing splint	Turns lime water milky						
Gas	Hydrogen	Oxygen	Carbon Dioxide													
Gas Test	Burns with a pop	Relights glowing splint	Turns lime water milky													
4c	E	$\text{glucose} + \text{oxygen} \longrightarrow \text{carbon dioxide} + \text{water}$ $C_6H_{12}O_6 + 6O_2 \longrightarrow 6CO_2 + 6H_2O$														
4d	B	ACID + METAL \longrightarrow SALT + HYDROGEN														
5a	F	Blast Furnace: iron oxide + carbon \longrightarrow iron + carbon dioxide														
5b	D	Galvanising: Zinc coating sacrificially protects iron (or steel) underneath														
6a	B	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 10%;">Compound</td> <td style="width: 15%;">lead sulphate</td> <td style="width: 15%;">sodium chloride</td> <td style="width: 15%;">calcium hydroxide</td> <td style="width: 15%;">potassium phosphate</td> </tr> <tr> <td>Elements</td> <td>lead + sulphur + oxygen</td> <td>sodium + chlorine</td> <td>calcium + hydrogen + oxygen</td> <td>potassium + phosphorus + oxygen</td> </tr> </table>	Compound	lead sulphate	sodium chloride	calcium hydroxide	potassium phosphate	Elements	lead + sulphur + oxygen	sodium + chlorine	calcium + hydrogen + oxygen	potassium + phosphorus + oxygen				
Compound	lead sulphate	sodium chloride	calcium hydroxide	potassium phosphate												
Elements	lead + sulphur + oxygen	sodium + chlorine	calcium + hydrogen + oxygen	potassium + phosphorus + oxygen												
6b	C	ACID + METAL HYDROXIDE \longrightarrow SALT + WATER <small>(alkali)</small> Hydrochloric acid + calcium hydroxide \longrightarrow calcium chloride + water														
7	A,C <small>1 mark each</small>	<input checked="" type="checkbox"/> A Glucose has the formula $C_6H_{12}O_6$ and is classified as a carbohydrate <input checked="" type="checkbox"/> B Small carbohydrates like sugars are soluble in water <input checked="" type="checkbox"/> C Photosynthesis: carbon dioxide + water \longrightarrow glucose + oxygen <input checked="" type="checkbox"/> D Test for starch: Iodine solution turning blue/black <input checked="" type="checkbox"/> E Small molecules like glucose are small enough to pass through the gut wall into the blood														
8	A,E <small>1 mark each</small>	<input checked="" type="checkbox"/> A Silver and gold are both transition metals as they are found in the block between groups 2+3 <input checked="" type="checkbox"/> B Silver and gold are metals \therefore both conduct electricity <input checked="" type="checkbox"/> C Lead is above both silver and gold in the Reactivity Series <input checked="" type="checkbox"/> D Silver and gold are unreactive metals and do not react with hydrochloric acid <input checked="" type="checkbox"/> E Silver and gold are unreactive metals and are both found uncombined in the Earth's crust														

Question	Answer	Chemistry Covered										
9a	exothermic	<table border="1"> <tr> <td>Exothermic</td> <td>Reaction which gives out heat</td> </tr> <tr> <td>Endothermic</td> <td>Reaction which takes in heat from the surroundings</td> </tr> </table>	Exothermic	Reaction which gives out heat	Endothermic	Reaction which takes in heat from the surroundings						
Exothermic	Reaction which gives out heat											
Endothermic	Reaction which takes in heat from the surroundings											
9b	Will run out eventually	Finite resources are resources which will not go on for ever and will run out with overuse.										
9c	Crude oil or natural gas	Fossil Fuels: coal, oil, (natural) gas and peat.										
10a	<table border="1"> <tr> <td>12</td> <td>Metal</td> </tr> <tr> <td>17</td> <td>Non-metal</td> </tr> </table>	12	Metal	17	Non-metal	Atomic Number: number of protons in an atom Metals are found on the left hand side of STEPS on Periodic Table						
12	Metal											
17	Non-metal											
10b(i)	MgCl ₂	<table border="1"> <tr> <td>Write down Valency below each element's symbol</td> <td>Put in Cross-over Arrows</td> <td>Follow arrows to get formula</td> </tr> <tr> <td> Mg Cl 2 1 </td> <td> Mg Cl ↙ ↘ 2 1 </td> <td>MgCl₂</td> </tr> </table>	Write down Valency below each element's symbol	Put in Cross-over Arrows	Follow arrows to get formula	Mg Cl 2 1	Mg Cl ↙ ↘ 2 1	MgCl ₂				
Write down Valency below each element's symbol	Put in Cross-over Arrows	Follow arrows to get formula										
Mg Cl 2 1	Mg Cl ↙ ↘ 2 1	MgCl ₂										
10b(ii)	1412 714	Melting and Boiling points of selected compounds are found on p5 of data booklet.										
10b(iii)	Liquid	At 1000°C: magnesium chloride has melted (mpt=714°C) At 1000°C: magnesium chloride has yet to boil (bpt=1412°C)										
11a	<table border="1"> <thead> <tr> <th>Plastic</th> <th>Use</th> </tr> </thead> <tbody> <tr> <td>Perspex</td> <td>Advertising signs</td> </tr> <tr> <td>PVC</td> <td>Artificial limbs</td> </tr> <tr> <td>Polythene</td> <td>Carrier bags</td> </tr> <tr> <td>Polystyrene</td> <td>Egg cartons</td> </tr> </tbody> </table>	Plastic	Use	Perspex	Advertising signs	PVC	Artificial limbs	Polythene	Carrier bags	Polystyrene	Egg cartons	Problem Solving: Paragraph of information → table
Plastic	Use											
Perspex	Advertising signs											
PVC	Artificial limbs											
Polythene	Carrier bags											
Polystyrene	Egg cartons											
11b	Gets broken down by bacteria	<table border="1"> <tr> <td>Biodegradable</td> <td>get broken down by living organisms like bacteria and eventually disappear.</td> </tr> <tr> <td>Non-Biodegradable</td> <td>Do not get broken down by living organisms like bacteria and last a long time.</td> </tr> </table>	Biodegradable	get broken down by living organisms like bacteria and eventually disappear.	Non-Biodegradable	Do not get broken down by living organisms like bacteria and last a long time.						
Biodegradable	get broken down by living organisms like bacteria and eventually disappear.											
Non-Biodegradable	Do not get broken down by living organisms like bacteria and last a long time.											
11c	Thermoplastic	<table border="1"> <tr> <td>Thermoplastic</td> <td>Will reshape/melt on heating</td> </tr> <tr> <td>Thermosetting</td> <td>Do not reshape/melt on heating</td> </tr> </table>	Thermoplastic	Will reshape/melt on heating	Thermosetting	Do not reshape/melt on heating						
Thermoplastic	Will reshape/melt on heating											
Thermosetting	Do not reshape/melt on heating											
11d	Styrene	<table border="1"> <tr> <td>Polymer</td> <td>poly(ethene)</td> <td>poly(propene)</td> <td>poly(chloroethene)</td> <td>poly(styrene)</td> </tr> <tr> <td>Monomer</td> <td>ethene</td> <td>propene</td> <td>chloroethene</td> <td>styrene</td> </tr> </table>	Polymer	poly(ethene)	poly(propene)	poly(chloroethene)	poly(styrene)	Monomer	ethene	propene	chloroethene	styrene
Polymer	poly(ethene)	poly(propene)	poly(chloroethene)	poly(styrene)								
Monomer	ethene	propene	chloroethene	styrene								
11e	Polymerisation Or Addition Polymerisation	Polymerisation: process where monomers join together to make a bigger molecule (polymer)										
12a	chlorine	Positive electrode: $2Cl^- \longrightarrow Cl_2 + 2e^-$ Negative Electrode: $Cu^{2+} + 2e^- \longrightarrow Cu$										
12b	electrons	Electrons travel through the wires Ions travel through the solution										
12c	carbon or graphite	Graphite, a form of carbon, is the only non-metal conductor of electricity and is suitable for use as an electrode										
13a	0.8g or the same	Catalysts are chemically unchanged during reactions ∴ same mass of catalysts at start and end of reaction										
13b(i)	Cracking	<table border="1"> <tr> <td>Starting Chemicals</td> <td>large, saturated and less useful</td> </tr> <tr> <td>Products</td> <td>smaller, more useful and some unsaturated</td> </tr> </table>	Starting Chemicals	large, saturated and less useful	Products	smaller, more useful and some unsaturated						
Starting Chemicals	large, saturated and less useful											
Products	smaller, more useful and some unsaturated											

13b(ii)	C_7H_{14}	C_7H_{14} : heptene - alkene with general formula C_nH_{2n} C_9H_{20} : nonane - alkane with general formula C_nH_{2n+2}																
14a	bar chart containing:	$\frac{1}{2}$ mark - vertical scale $\frac{1}{2}$ mark - correct labelling of bars 1 mark - bars drawn correctly ($\frac{1}{2}$ box error allowed)																
14b	2 atoms joined together	Diatomic molecules have 2 atoms joined together by covalent bonds: <table border="1"> <thead> <tr> <th>Element</th> <th>hydrogen</th> <th>nitrogen</th> <th>oxygen</th> <th>fluorine</th> <th>chlorine</th> <th>bromine</th> <th>iodine</th> </tr> </thead> <tbody> <tr> <th>Formula</th> <td>H_2</td> <td>N_2</td> <td>O_2</td> <td>F_2</td> <td>Cl_2</td> <td>Br_2</td> <td>I_2</td> </tr> </tbody> </table>	Element	hydrogen	nitrogen	oxygen	fluorine	chlorine	bromine	iodine	Formula	H_2	N_2	O_2	F_2	Cl_2	Br_2	I_2
Element	hydrogen	nitrogen	oxygen	fluorine	chlorine	bromine	iodine											
Formula	H_2	N_2	O_2	F_2	Cl_2	Br_2	I_2											
14c	Alloys	Alloys are mixture of metals (or mixture of metals with non-metals) e.g. Steel, stainless steel, brass, bronze, solder, amalgam, cupro-nickel																
14d(i)	Intact tin-layer is barrier to water/air	Tin-layers outside steel will prevent air/water getting to steel underneath and thus prevent corrosion. If the tin layer gets scratched and the steel is exposed to air/water, the iron underneath sacrificially corrodes to protect the tin layer instead.																
14d(ii)	Mg or Zn or Al	zinc, aluminium, magnesium would provide sacrificial protection. Calcium, lithium, sodium, potassium would also provide sacrificial protection to steel but are too reactive to work in practice.																
15a	will run out/need replaced or more expensive than mains	<table border="1"> <thead> <tr> <th>Advantages of Batteries</th> <th>Advantages of Mains</th> </tr> </thead> <tbody> <tr> <td>portable</td> <td>will run out/need replaced</td> </tr> <tr> <td>low voltage</td> <td>high voltages available</td> </tr> <tr> <td>safer</td> <td></td> </tr> </tbody> </table>	Advantages of Batteries	Advantages of Mains	portable	will run out/need replaced	low voltage	high voltages available	safer									
Advantages of Batteries	Advantages of Mains																	
portable	will run out/need replaced																	
low voltage	high voltages available																	
safer																		
15b(i)	Value between 0.5V - 2.7V	Magnesium is higher up electrochemical series than iron \therefore voltage will be less than 2.7V Tin is lower down electrochemical series than iron \therefore voltage will be more than 0.5V																
15b(ii)	Any one from:	<table border="1"> <tbody> <tr> <td>Any one from:</td> <td>volume + concentration of electrolyte</td> </tr> <tr> <td>temperature</td> <td>distance between electrodes</td> </tr> <tr> <td>size of rods</td> <td>depth of rod immersion</td> </tr> </tbody> </table>	Any one from:	volume + concentration of electrolyte	temperature	distance between electrodes	size of rods	depth of rod immersion										
Any one from:	volume + concentration of electrolyte																	
temperature	distance between electrodes																	
size of rods	depth of rod immersion																	
16a(i)	man-made or not natural	Synthetic materials are made by the chemical industry and do not occur naturally on Earth																
16a(ii)	Potassium K or phosphorus P	3 essential elements for plant growth are: Potassium, Phosphorus and Nitrogen																
16b	Ammonia or NH_3	$\begin{array}{l} \text{ammonium} \quad + \quad \text{calcium} \\ \text{nitrate} \quad \quad \quad \text{hydroxide} \end{array} \longrightarrow \begin{array}{l} \text{calcium} \\ \text{nitrate} \end{array} + \text{water} + \text{ammonia}$ $2NH_4NO_3 + Ca(OH)_2 \longrightarrow Ca(NO_3)_2 + 2H_2O + 2NH_3$																
17a	Biological catalyst	Enzymes are biological catalysts which are designed to work best at $37^\circ C$																
17b	$C_3H_6O_3$ any order of elements is acceptable																	

17c	Sugar/Glucose is used up by fermentation or So alcohol is not produced or So sugar would not ferment	$\text{glucose} \xrightarrow[\text{enzymes}]{\text{no air}} \text{ethanol} + \text{carbon dioxide}$ $\text{C}_6\text{H}_{12}\text{O}_6 \longrightarrow 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2$																														
18a	check colour chart against colour to get pH number	The colour obtained in the gas jar is matched against the colours on the pH colour chart. The corresponding number is the pH of the solution.																														
18b	any pH less than 7	Phosphorus oxide is a non-metal oxide. Non-metals oxides dissolve in water to form acids e.g. CO_2 , NO_2 and SO_2 (but not CO)																														
18c	it is insoluble	Aluminium oxide is insoluble (p8 of data booklet)																														
19a	higher the number of carbons, the lower the octane number	For both alkanes and alkenes, every time a carbon is added to the chain length, the octane number falls each time.																														
19b	99-108	Answer must be higher than 98																														
19b	99-108	<table border="1"> <thead> <tr> <th>Alkene</th> <th>Propene</th> <th>Butene</th> <th>Pentene</th> <th>Hexene</th> <th>Heptene</th> </tr> </thead> <tbody> <tr> <td>No. of Carbons</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> <td>7</td> </tr> <tr> <td>Octane Number</td> <td>-</td> <td>98</td> <td>93</td> <td>85</td> <td>75</td> </tr> <tr> <td>Difference:</td> <td></td> <td>average (7)</td> <td>5</td> <td>8</td> <td>10</td> </tr> <tr> <td>Prediction:</td> <td>105</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> </tr> </tbody> </table>	Alkene	Propene	Butene	Pentene	Hexene	Heptene	No. of Carbons	3	4	5	6	7	Octane Number	-	98	93	85	75	Difference:		average (7)	5	8	10	Prediction:	105	-	-	-	-
Alkene	Propene	Butene	Pentene	Hexene	Heptene																											
No. of Carbons	3	4	5	6	7																											
Octane Number	-	98	93	85	75																											
Difference:		average (7)	5	8	10																											
Prediction:	105	-	-	-	-																											
19c	octane number of alkanes lower than octane number of alkene	The octane number of an alkane is always lower than octane number of corresponding alkene
