2010 General	KU		PS	
	/30	%	/30	%
3	20+	67%	19+	63%
4	15+	50%	13+	43%
5	12+	40%	11+	37%
7	<12	<40%	<11	<37%

## 2010 Standard Grade Chemistry General Marking Scheme

Question	Answer	Chemistry Covered							
1a	B	Answer	A	B	C	D	E	F	
		Symbol	Pt	Na	P	N	S	Ne	
1b	E	Name	Platinum	Sodium	Phosphorus	Nitrogen	Sulphur	Neon	
		Discovery	16 <sup>th</sup> Century	1807	1669	1772	Pre-historic	1898	
1c	F	Group	transition metal	Group 1 (alkali metal)	Group 5	Group 5	Group 6	Group 0 (Noble Gas)	
2a	C	Answer	Reagent	Test for		Colour Change			
		A	Bromine Solution	unsaturation (C=C bonds)		decolourises			
		B	Ferroxyl Indicator	Fe <sup>2+</sup> ions		turns deep blue			
2b	E	C	Universal Indicator	acidity/alkalinity		red for acid/purple for alkali			
		D	Lime Water	carbon dioxide		turns milky			
		E	Benedict's Solution	reducing sugars e.g. glucose		blue → brick red			
		F	Iodine Solution	starch		turns blue/black			
3a	D+F Both for 1 mark		Acidic pH<7	Neutral pH=7	Alkaline pH>7				
3b	A+E Both for 1 mark	In a fair test comparison: <ul style="list-style-type: none"> <li>• pH is the factor identified in the question as changing</li> <li>• type of material and temperature must be the same</li> </ul>							
4a	B	The sparking of nitrogen and oxygen in air forms nitrogen dioxide							
4b	A	Compound	potassium oxide	nitrogen dioxide	carbon monoxide	carbon dioxide	hydrogen oxide	sulphur dioxide	
		In water	alkaline	acidic	(insoluble)	acidic	neutral	acidic	
5a	D+F Both for 1 mark	Compound	copper chloride	sodium oxide	lithium fluoride	sulphur dioxide	barium fluoride	silicon chloride	
		Elements in Compound	metal + non-metal	metal + non-metal	metal + non-metal	non-metals only	metal + non-metal	non-metals only	
		Type of Bonding	ionic	ionic	ionic	covalent molecules	ionic	covalent molecules	
5b	C	Compound	CuCl <sub>2</sub>	Na <sub>2</sub> O	LiF	SO <sub>2</sub>	BaF <sub>2</sub>	SiCl <sub>4</sub>	
		Flame Colour	green	orange	red	(no colour)	green	(no colour)	
6a	B	Answer	Reaction Type	Definition					
6b	E	A	Neutralisation	Acid (H <sup>+</sup> ions) will react with a base to form water					
		B	Photosynthesis	Carbon dioxide and water react to form glucose and water. Light energy is absorbed by chlorophyll to power the reaction					
6c	C	C	Addition	Molecule added across a C=C double bond					
		D	Polymerisation	Small molecules join together to make larger polymer					
		E	Corrosion	Metals losing electrons to form metals ions					
		F	Combustion	Substance burning and joining up with oxygen					
7a	A	Metals conduct in the solid state and in the liquid (molten) state. Metals do not dissolve in water				Bonding	Solid	Liquid	Solution
7b	C+E Both for 1 mark					Covalent substances do not conduct in any state.			
		Covalent <small>(non-metals only)</small>	x	x	x				
		Ionic <small>(metals +non-metals)</small>	x	✓	✓				

8	A,E 1 mark each	<input checked="" type="checkbox"/> A hydrochloric acid + potassium hydroxide → potassium chloride + water <input checked="" type="checkbox"/> B the pH increases as the acid reacts and is used up <input checked="" type="checkbox"/> C no gas is produced when an acid + alkali react to form a salt + water <input checked="" type="checkbox"/> D no gas is produced when an acid + alkali react to form a salt + water <input checked="" type="checkbox"/> E hydrochloric acid + potassium hydroxide → potassium chloride + water
9	A,D 1 mark each	<input checked="" type="checkbox"/> A $\text{Na} \longrightarrow \text{Na}^+ + \text{e}^-$ <input checked="" type="checkbox"/> B Sodium atoms have 11 electrons and neon atoms have 10 electrons <input checked="" type="checkbox"/> C sodium has atomic number=11 and lithium has atomic no =3 <input checked="" type="checkbox"/> D bromine is bigger than sodium as it has more occupied electron shells <input checked="" type="checkbox"/> E sodium and potassium have similar chemical properties (both in group 1)

Question	Answer	Chemistry Covered															
10a	millions  sea bed	<table border="1"> <thead> <tr> <th>Step</th> <th>How <b>Coal</b> is Made</th> <th>How <b>Crude Oil</b> is Made</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Dead trees fall to bottom of swamp</td> <td>Dead sea organisms fall to bottom of sea</td> </tr> <tr> <td>2</td> <td>Materials get covered up by mud</td> <td>Materials get covered up by sand</td> </tr> <tr> <td>3</td> <td>Layers of rock above provide pressure</td> <td>Layers of rock above provide pressure</td> </tr> <tr> <td>4</td> <td>Over millions of years turns into coal</td> <td>Over millions of years turns into crude oil</td> </tr> </tbody> </table>	Step	How <b>Coal</b> is Made	How <b>Crude Oil</b> is Made	1	Dead trees fall to bottom of swamp	Dead sea organisms fall to bottom of sea	2	Materials get covered up by mud	Materials get covered up by sand	3	Layers of rock above provide pressure	Layers of rock above provide pressure	4	Over millions of years turns into coal	Over millions of years turns into crude oil
Step	How <b>Coal</b> is Made	How <b>Crude Oil</b> is Made															
1	Dead trees fall to bottom of swamp	Dead sea organisms fall to bottom of sea															
2	Materials get covered up by mud	Materials get covered up by sand															
3	Layers of rock above provide pressure	Layers of rock above provide pressure															
4	Over millions of years turns into coal	Over millions of years turns into crude oil															
10b	sulphur dioxide	<p>Sulphur is found in some fossil fuels and burns to form sulphur dioxide.  Sulphur dioxide dissolves in rain water to form acid rain.  NB Nitrogen dioxide also causes acid rain but is formed by sparking of nitrogen and oxygen in air</p>															
10c	covalent bonds	Methane $\text{CH}_4$ is a covalent molecule as it is made up on non-metal atoms only.															
11a(i)	Relights a glowing splint	<table border="1"> <thead> <tr> <th>Gas</th> <th>Hydrogen</th> <th>Oxygen</th> <th>Carbon Dioxide</th> </tr> </thead> <tbody> <tr> <td>Test</td> <td>burns with a pop</td> <td>relights a glowing splint</td> <td>turns lime water milky</td> </tr> </tbody> </table>	Gas	Hydrogen	Oxygen	Carbon Dioxide	Test	burns with a pop	relights a glowing splint	turns lime water milky							
Gas	Hydrogen	Oxygen	Carbon Dioxide														
Test	burns with a pop	relights a glowing splint	turns lime water milky														
11a(ii)	<table border="1"> <tr> <td>X carbon dioxide</td> <td>Y water</td> </tr> </table>	X carbon dioxide	Y water	$6\text{CO}_2 + 6\text{H}_2\text{O} \xrightarrow[\text{light}]{\text{chlorophyll}} \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$													
X carbon dioxide	Y water																
11b(i)	bar chart containing:	<table border="1"> <tr> <td><math>\frac{1}{2}</math> mark vertical scale</td> <td><math>\frac{1}{2}</math> mark correct labelling of bars</td> <td>1 mark bars drawn correctly</td> </tr> </table>	$\frac{1}{2}$ mark vertical scale	$\frac{1}{2}$ mark correct labelling of bars	1 mark bars drawn correctly												
$\frac{1}{2}$ mark vertical scale	$\frac{1}{2}$ mark correct labelling of bars	1 mark bars drawn correctly															
11b(ii)	One from:	<table border="1"> <tr> <td>temperature of water</td> <td>distance of lamp from plant</td> <td>volume of water</td> <td>light intensity or colour of light</td> <td>lamp always on</td> </tr> <tr> <td>same size of beaker or test tube</td> <td>number of leaves or size of leaves</td> <td>brightness</td> <td>size of plant or surface area</td> <td>number of plants</td> </tr> </table>	temperature of water	distance of lamp from plant	volume of water	light intensity or colour of light	lamp always on	same size of beaker or test tube	number of leaves or size of leaves	brightness	size of plant or surface area	number of plants					
temperature of water	distance of lamp from plant	volume of water	light intensity or colour of light	lamp always on													
same size of beaker or test tube	number of leaves or size of leaves	brightness	size of plant or surface area	number of plants													
12a	$\text{C}_4\text{H}_{10} + \text{O}_2 \downarrow \text{CO}_2 + \text{H}_2\text{O}$	<p>butane + oxygen → carbon dioxide + water  <math>\text{C}_4\text{H}_{10} + \text{O}_2 \longrightarrow \text{CO}_2 + \text{H}_2\text{O}</math></p> <p>Formula of butane is found in question      Oxygen is a diatomic element      "Di" in name means straight to formula      Cross over rule to formula of Water</p>															
12b(i)	good conductor of heat or does not corrode	A good conductor of heat is a desirable property in a cooking pot Aluminium is anodised to prevent corrosion and will lengthen the pot's life															
12b(ii)	Thermosetting	<table border="1"> <tr> <td>Thermoplastic</td> <td>Will reshape/melt on heating</td> </tr> <tr> <td>Thermosetting</td> <td>Does not reshape/melt on heating</td> </tr> </table>	Thermoplastic	Will reshape/melt on heating	Thermosetting	Does not reshape/melt on heating											
Thermoplastic	Will reshape/melt on heating																
Thermosetting	Does not reshape/melt on heating																
12c	Soot or carbon	Incomplete combustion of the butane fuel in the camping gas will form poisonous carbon monoxide gas and soot (carbon) on the bottom of the pot															
13a	Potassium, carbon and oxygen	<table border="1"> <thead> <tr> <th>Ending</th> <th>Meaning</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>-ide</td> <td>2 elements in compound</td> <td>Copper sulphide = copper + sulphur</td> </tr> <tr> <td>-ate</td> <td>2 elements in compound + oxygen</td> <td>Copper sulphate = copper + sulphur + oxygen</td> </tr> <tr> <td>-ite</td> <td>2 elements in compound + oxygen</td> <td>Sodium sulphite = sodium + sulphur + oxygen</td> </tr> </tbody> </table>	Ending	Meaning	Example	-ide	2 elements in compound	Copper sulphide = copper + sulphur	-ate	2 elements in compound + oxygen	Copper sulphate = copper + sulphur + oxygen	-ite	2 elements in compound + oxygen	Sodium sulphite = sodium + sulphur + oxygen			
Ending	Meaning	Example															
-ide	2 elements in compound	Copper sulphide = copper + sulphur															
-ate	2 elements in compound + oxygen	Copper sulphate = copper + sulphur + oxygen															
-ite	2 elements in compound + oxygen	Sodium sulphite = sodium + sulphur + oxygen															
13b(i)	precipitation	Chemical reaction where an insoluble substance is formed when two solutions are mixed															
13b(ii)	potassium nitrate	$\text{potassium carbonate} + \text{copper nitrate} \longrightarrow \text{potassium nitrate} + \text{copper carbonate}$ <p style="text-align: center;"> <span style="margin-right: 100px;">Soluble</span> <span style="margin-right: 100px;">Insoluble</span> </p> <p style="text-align: center;"> <span style="margin-right: 100px;">(dissolved in solution)</span> <span>(precipitate)</span> </p>															

13b(iii)	Filtration	Insoluble precipitates are removed by filtering through filter paper <ul style="list-style-type: none"> <li>copper carbonate precipitate collects as residue in filter paper</li> <li>potassium nitrate solution passes through filter paper as filtrate</li> </ul>										
14a	Table showing:	<table border="1"> <thead> <tr> <th>Element Added to Iron</th> <th>Use of Steel</th> </tr> </thead> <tbody> <tr> <td>Chromium</td> <td>Cooking Pots</td> </tr> <tr> <td>Manganese</td> <td>Railway Tracks</td> </tr> <tr> <td>Titanium</td> <td>Aircraft Bodies</td> </tr> <tr> <td>Tungsten</td> <td>Hammers</td> </tr> </tbody> </table>	Element Added to Iron	Use of Steel	Chromium	Cooking Pots	Manganese	Railway Tracks	Titanium	Aircraft Bodies	Tungsten	Hammers
Element Added to Iron	Use of Steel											
Chromium	Cooking Pots											
Manganese	Railway Tracks											
Titanium	Aircraft Bodies											
Tungsten	Hammers											
14b(i)	oxygen/air and water	Both oxygen in air and water are required for corrosion/rusting to occur. If either oxygen/air or water are removed then corrosion/rusting will not occur. <ul style="list-style-type: none"> <li>Silica gel can be used to remove water moisture</li> <li>Boiling water removes air dissolved in water</li> </ul>										
14b(ii)	sacrificial protection	Magnesium is higher up electrochemical series than iron (p10 data booklet) Magnesium will sacrificially protect iron by giving the iron electrons										
14c	one from:	<table border="1"> <tbody> <tr> <td>Painting</td> <td>Greasing</td> <td>Coating In Plastic</td> </tr> <tr> <td>Galvanising</td> <td>Tin plating</td> <td>Cathodic Protection</td> </tr> </tbody> </table>	Painting	Greasing	Coating In Plastic	Galvanising	Tin plating	Cathodic Protection				
Painting	Greasing	Coating In Plastic										
Galvanising	Tin plating	Cathodic Protection										
15a	diatomic	A diatomic molecule is a 2 atom molecule joined by covalent bond(s)										
15b	electrolysis	Electrolysis is the passing of d.c. current resulting in the breakdown of the compound back into elements. The ionic substance must be molten or in solution as ions are not free to move in the solid state.										
15c(i)	no CO <sub>2</sub> produced or no greenhouse gases	The fuel cell does not involve the combustion of carbon compounds and does not produce carbon dioxide as a waste product. Carbon dioxide contributes to the Greenhouse Effect (Global Warming or climate change)										
15c(ii)	air or water	Air contains 21% oxygen and the oxygen can be separated easily by distillation. Water has the formula H <sub>2</sub> O and the oxygen can be extracted by electrolysis										
15c(iii)	Speeds up chemical reaction	A catalyst speeds up a chemical reaction but the catalyst is not used up in the reaction and can be fully recovered at the end of the reaction.										
16a	potassium or phosphorus	Fertilisers are soluble compounds containing the elements: <table border="1"> <tbody> <tr> <td>Nitrogen</td> <td>Phosphorus</td> <td>Potassium</td> </tr> </tbody> </table>	Nitrogen	Phosphorus	Potassium							
Nitrogen	Phosphorus	Potassium										
16b	Must be soluble in water	A fertiliser is a soluble compound with one or more of the following elements: nitrogen, potassium and phosphorus										
16c	root nodules	Nitrifying bacteria in root nodules of leguminous plants are able to fix nitrogen from the atmosphere into nitrate compounds. e.g. clover, pea family and bean family										
17a	Alkanes	Homologous series are a family of compounds with the same chemical properties and a general formula. <table border="1"> <tbody> <tr> <td>Alkanes</td> <td>Alkenes</td> <td>Cycloalkanes</td> <td>Alcohols</td> <td>Carboxylic Acids</td> </tr> </tbody> </table>	Alkanes	Alkenes	Cycloalkanes	Alcohols	Carboxylic Acids					
Alkanes	Alkenes	Cycloalkanes	Alcohols	Carboxylic Acids								
17b(i)	aluminium oxide  bromine solution  test tube	The aluminium catalyst is heated first to raise its temperature enough to make it work effectively as a catalyst The octane in the test tube is heated carefully and octane vapour passes over the aluminium catalyst and cracks in smaller hydrocarbons, some of which are unsaturated with C=C double bonds. The gases given off bubble through the bromine solution and the unsaturated products will decolourise the bromine solution										
17b(ii)	C <sub>5</sub> H <sub>12</sub>	$\text{C}_8\text{H}_{18} \longrightarrow \text{C}_3\text{H}_6 + \text{C}_5\text{H}_{12}$ <p style="text-align: center;">saturated                      unsaturated      saturated</p>										
17b(iii)	poly(propene)	C <sub>3</sub> H <sub>6</sub> is the formula of both propene and cyclopropane. To be turned into a plastic, the monomer must have a C=C double bond ∴ C <sub>3</sub> H <sub>6</sub> is propene. If monomer is propene then the name of the polymer is poly(propene).										

18a	Solvent	solution	a mixture formed when a solute dissolves in a solvent
		solute	The substance that is dissolved
		solvent	The liquid that does the dissolving
18b(i)	Increasing temperature increases the solubility	Problem Solving: Interpretation of graph to work out a trend	
18b(ii)	52-53cm <sup>3</sup>	Problem Solving: Estimation of point on a line graph	
19a	From right to left ← (iron to copper)	Iron is higher up the electrochemical series than copper (p10 data booklet) Electrons always flow from the higher up metal to the lower down metal.	
19b	Ions free to move in solution	In solid ionic substances, the ions are held tightly in a lattice of oppositely charged ions and are unable to move. This prevents conduction of electricity. When ionic substances are melted or dissolved, the tightly held lattice breaks up and the substance is able to conduct as the ions can move to the oppositely charged electrode.	
19c	Nickel, Tin or Lead	<p>The electrochemical series is found on p10 of the data booklet</p> <p>Magnesium</p> <p>Aluminium</p> <p>Zinc</p> <p>Iron ←—————</p> <p>Nickel ←.....</p> <p>Tin ←.....</p> <p>Lead ←.....</p> <p>Copper</p> <p>Replacing iron with one of these metals will decrease the voltage</p>	
19d	To complete the circuit	The ion bridge is a piece of filter soaked in an electrolyte e.g. salt solution. The ion bridge completes the circuit by allow charged ions to travel from side to side to balance out the movement of negative charge in the electrical current.
