# 2002 Standard Grade Chemistry General Marking Scheme

Question	Answer	Chemistry Covered																					
1a	B	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 15%;">Group</td> <td style="width: 25%;">1</td> <td style="width: 25%;">7</td> <td style="width: 25%;">0</td> <td style="width: 30%;">Block Between Groups 2+3</td> </tr> <tr> <td>Name</td> <td>alkali metals</td> <td>halogen</td> <td>noble gases</td> <td>transition metals</td> </tr> </table>	Group	1	7	0	Block Between Groups 2+3	Name	alkali metals	halogen	noble gases	transition metals											
Group	1	7	0	Block Between Groups 2+3																			
Name	alkali metals	halogen	noble gases	transition metals																			
1b	A	Elements with atomic number of 85 and 87 and elements with atomic number above 92 are made by scientists. Curium has an atomic number of 96.																					
1c	E	<b>Ammonia + Oxygen</b> $\xrightarrow[\text{catalyst}]{\text{platinum}}$ <b>Nitrogen Dioxide + Water</b> Nitrogen Dioxide dissolves in Water to make Nitric Acid																					
2a	B	<b>ACID + METAL → SALT + HYDROGEN</b>																					
2b	E+F <small>Both for 1 mark</small>	Diatomic molecules are 2 atoms joined together by one or more bonds.																					
2c	A	Carbon monoxide is a poisonous gas produced by incomplete combustion when there is a limited supply of oxygen.																					
3a	A+B <small>Both for 1 mark</small>	Cracking breaks saturated hydrocarbons into smaller hydrocarbons, some of them have C=C double bonds. Propene has 3 carbons and any answer with more than 3 carbons must be incorrect.																					
3b	B+F <small>Both for 1 mark</small>	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 15%;">Formula</td> <td style="width: 15%;">CH<sub>4</sub></td> <td style="width: 15%;">C<sub>2</sub>H<sub>4</sub></td> <td style="width: 15%;">C<sub>6</sub>H<sub>14</sub></td> <td style="width: 15%;">C<sub>5</sub>H<sub>12</sub></td> <td style="width: 15%;">C<sub>4</sub>H<sub>10</sub></td> <td style="width: 15%;">C<sub>4</sub>H<sub>8</sub></td> </tr> <tr> <td>Name</td> <td>methane</td> <td>ethene</td> <td>hexane</td> <td>pentane</td> <td>butane</td> <td>butene</td> </tr> <tr> <td>Saturation</td> <td>(alkane) saturated</td> <td>(alkene) <b>unsaturate</b> <b>d</b></td> <td>(alkane) saturated</td> <td>(alkane) saturated</td> <td>(alkane) saturated</td> <td>(alkene) <b>unsaturate</b> <b>d</b></td> </tr> </table>	Formula	CH <sub>4</sub>	C <sub>2</sub> H <sub>4</sub>	C <sub>6</sub> H <sub>14</sub>	C <sub>5</sub> H <sub>12</sub>	C <sub>4</sub> H <sub>10</sub>	C <sub>4</sub> H <sub>8</sub>	Name	methane	ethene	hexane	pentane	butane	butene	Saturation	(alkane) saturated	(alkene) <b>unsaturate</b> <b>d</b>	(alkane) saturated	(alkane) saturated	(alkane) saturated	(alkene) <b>unsaturate</b> <b>d</b>
Formula	CH <sub>4</sub>	C <sub>2</sub> H <sub>4</sub>	C <sub>6</sub> H <sub>14</sub>	C <sub>5</sub> H <sub>12</sub>	C <sub>4</sub> H <sub>10</sub>	C <sub>4</sub> H <sub>8</sub>																	
Name	methane	ethene	hexane	pentane	butane	butene																	
Saturation	(alkane) saturated	(alkene) <b>unsaturate</b> <b>d</b>	(alkane) saturated	(alkane) saturated	(alkane) saturated	(alkene) <b>unsaturate</b> <b>d</b>

Boiling Pt	-162°C	-104°C	<b>69°C</b>	36°C	-1°C	-6°C																	
4a	B	carbon dioxide + water $\xrightarrow[\text{light}]{\text{chlorophyll}}$ glucose + oxygen $6\text{CO}_2 + 6\text{H}_2\text{O} \longrightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$																					
4b	C	Fractional distillation separates substances with different boiling points																					
4c	D+E <small>Both for 1 mark</small>	Electroplating: Preventing corrosion by covering metal is less reactive metal Galvanising: Prevents corrosion of iron by sacrificial protection by zinc layer																					
5a	A+C <small>Both for 1 mark</small>	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <thead> <tr> <th style="width: 15%;">Ending</th> <th style="width: 40%;">Meaning</th> <th style="width: 45%;">Example</th> </tr> </thead> <tbody> <tr> <td>-ide</td> <td>2 elements in compound</td> <td>Copper sulphide = copper + sulphur</td> </tr> <tr> <td>-ate</td> <td>2 elements in compound + oxygen</td> <td>Copper sulphate = copper + sulphur + oxygen</td> </tr> <tr> <td>-ite</td> <td>2 elements in compound + oxygen</td> <td>Sodium sulphite = sodium + sulphur + oxygen</td> </tr> </tbody> </table>	Ending	Meaning	Example	-ide	2 elements in compound	Copper sulphide = copper + sulphur	-ate	2 elements in compound + oxygen	Copper sulphate = copper + sulphur + oxygen	-ite	2 elements in compound + oxygen	Sodium sulphite = sodium + sulphur + oxygen									
Ending	Meaning	Example																					
-ide	2 elements in compound	Copper sulphide = copper + sulphur																					
-ate	2 elements in compound + oxygen	Copper sulphate = copper + sulphur + oxygen																					
-ite	2 elements in compound + oxygen	Sodium sulphite = sodium + sulphur + oxygen																					
5b	A	Acids are neutralised by bases: metal hydroxides (alkalis)                      metal oxides                      metal carbonates																					
6a	B	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td style="width: 10%;">A</td> <td style="width: 20%;">Redox</td> <td style="width: 70%;">2H<sup>+</sup> + Mg → Mg<sup>2+</sup> + H<sub>2</sub></td> </tr> <tr> <td>B</td> <td>Combustion</td> <td>CH<sub>4</sub> + 2O<sub>2</sub> → CO<sub>2</sub> + 2H<sub>2</sub>O</td> </tr> <tr> <td>C</td> <td>Addition</td> <td>C<sub>2</sub>H<sub>4</sub> + Br<sub>2</sub> → C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub></td> </tr> <tr> <td>D</td> <td>Electrolysis</td> <td>Cu<sup>2+</sup> + 2e<sup>-</sup> → Cu and 2Cl<sup>-</sup> → Cl<sub>2</sub> + 2e<sup>-</sup></td> </tr> <tr> <td>E</td> <td>Combustion</td> <td>2Mg + O<sub>2</sub> → 2MgO</td> </tr> <tr> <td>F</td> <td>Redox</td> <td>Fe + Cu<sup>2+</sup> → Fe<sup>2+</sup> + Cu</td> </tr> </table>	A	Redox	2H <sup>+</sup> + Mg → Mg <sup>2+</sup> + H <sub>2</sub>	B	Combustion	CH <sub>4</sub> + 2O <sub>2</sub> → CO <sub>2</sub> + 2H <sub>2</sub> O	C	Addition	C <sub>2</sub> H <sub>4</sub> + Br <sub>2</sub> → C <sub>2</sub> H <sub>4</sub> Br <sub>2</sub>	D	Electrolysis	Cu <sup>2+</sup> + 2e <sup>-</sup> → Cu and 2Cl <sup>-</sup> → Cl <sub>2</sub> + 2e <sup>-</sup>	E	Combustion	2Mg + O <sub>2</sub> → 2MgO	F	Redox	Fe + Cu <sup>2+</sup> → Fe <sup>2+</sup> + Cu			
A	Redox	2H <sup>+</sup> + Mg → Mg <sup>2+</sup> + H <sub>2</sub>																					
B	Combustion	CH <sub>4</sub> + 2O <sub>2</sub> → CO <sub>2</sub> + 2H <sub>2</sub> O																					
C	Addition	C <sub>2</sub> H <sub>4</sub> + Br <sub>2</sub> → C <sub>2</sub> H <sub>4</sub> Br <sub>2</sub>																					
D	Electrolysis	Cu <sup>2+</sup> + 2e <sup>-</sup> → Cu and 2Cl <sup>-</sup> → Cl <sub>2</sub> + 2e <sup>-</sup>																					
E	Combustion	2Mg + O <sub>2</sub> → 2MgO																					
F	Redox	Fe + Cu <sup>2+</sup> → Fe <sup>2+</sup> + Cu																					
6b	C																						
7a	A+E <small>Both for 1 mark</small>	Identify variable which is changing: particle size (lumps and powder) Other variables must be kept same: concentration (0.5mol/l) and Temp (20°C)																					
7b	E	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <th style="width: 20%;">Variable</th> <th style="width: 20%;">Concentration</th> <th style="width: 20%;">Temperature</th> <th style="width: 40%;">Particle Size</th> </tr> <tr> <td>Slowest</td> <td>0.5mol/l</td> <td>20°C</td> <td>lump</td> </tr> <tr> <td>Fastest</td> <td>2.0mol/l</td> <td>30°C</td> <td>powder</td> </tr> </table>	Variable	Concentration	Temperature	Particle Size	Slowest	0.5mol/l	20°C	lump	Fastest	2.0mol/l	30°C	powder									
Variable	Concentration	Temperature	Particle Size																				
Slowest	0.5mol/l	20°C	lump																				
Fastest	2.0mol/l	30°C	powder																				
8	A,D <small>1 mark each</small>	<input checked="" type="checkbox"/> A sulphur contains covalent bonding and is a non-conductor <input checked="" type="checkbox"/> B sucrose (C <sub>12</sub> H <sub>22</sub> O <sub>11</sub> ) contains covalent bonding and is a non-conductor <input checked="" type="checkbox"/> C copper chloride solution contains ionic bonding and is a conductor																					

D solid silver contains metallic bonding and is a conductor

Question	Answer	Chemistry Covered												
9a	thermosetting	<table border="1"> <tr> <td>Thermoplastic</td> <td>Will reshape/melt on heating</td> </tr> <tr> <td>Thermosetting</td> <td>Do not reshape/melt on heating</td> </tr> </table>	Thermoplastic	Will reshape/melt on heating	Thermosetting	Do not reshape/melt on heating								
Thermoplastic	Will reshape/melt on heating													
Thermosetting	Do not reshape/melt on heating													
9b	good conductor of heat	Metals are good at conducting heat energy. This is desirable in a cooking pot as it will respond quickly to quick changes in heat during cooking.												
10a	compound containing carbon & hydrogen only	Hydrocarbons are compounds which contain carbon and hydrogen only. Hydrocarbons often come in families e.g. alkanes, alkenes and cycloalkanes												
10b(i)	bar chart containing:	<table border="1"> <tr> <td><math>\frac{1}{2}</math> mark vertical scale</td> <td><math>\frac{1}{2}</math> mark correct labelling of bars</td> <td>1 mark bars drawn correctly</td> </tr> </table>	$\frac{1}{2}$ mark vertical scale	$\frac{1}{2}$ mark correct labelling of bars	1 mark bars drawn correctly									
$\frac{1}{2}$ mark vertical scale	$\frac{1}{2}$ mark correct labelling of bars	1 mark bars drawn correctly												
10b(ii)	residue	<table border="1"> <tr> <td>Fraction</td> <td>Refinery gas</td> <td>Naphtha</td> <td>Kerosene</td> <td>Gas Oils</td> <td>Residue</td> </tr> <tr> <td>Use</td> <td>Camping gas</td> <td>Petrol</td> <td>Aircraft fuel</td> <td>Diesel</td> <td>Tar/bitumen</td> </tr> </table>	Fraction	Refinery gas	Naphtha	Kerosene	Gas Oils	Residue	Use	Camping gas	Petrol	Aircraft fuel	Diesel	Tar/bitumen
Fraction	Refinery gas	Naphtha	Kerosene	Gas Oils	Residue									
Use	Camping gas	Petrol	Aircraft fuel	Diesel	Tar/bitumen									
11a(i)	chemicals run out	Cells/batteries are portable but run out when the chemicals in the battery are used up												
11a(ii)	contains potassium hydroxide	Batteries contain electrolyte to complete the circuit. In this battery, the electrolyte used is potassium hydroxide paste, which is alkaline.												
11a(iii)	ions cannot move when dry	Ions cannot move in the solid state but can move when in solution or molten												
11b	sulphuric acid	A car battery contains lead plates and fairly concentrated sulphuric acid. The car battery can be charged up as the car is being used.												
11c	portable	Batteries are portable and can be used anywhere. Mains electricity is limited to where power is supplied to.												
12a	T R S most reactive $\leftrightarrow$ least reactive	T is the most reactive as it gives of the biggest volume of gas. S is the least reactive as it did not react with acid at all												
12b	one from:	<table border="1"> <tr> <td>temperature</td> <td>mass of metal</td> <td>metal particle size</td> </tr> </table>	temperature	mass of metal	metal particle size									
temperature	mass of metal	metal particle size												
12c	potassium floats or catches fire	Potassium floats on water and catches fire.												
12d	burns with a pop	<table border="1"> <tr> <td>Gas</td> <td>Hydrogen</td> <td>Oxygen</td> <td>Carbon Dioxide</td> </tr> <tr> <td>Test</td> <td>burns with a pop</td> <td>relights a glowing splint</td> <td>turns lime water milky</td> </tr> </table>	Gas	Hydrogen	Oxygen	Carbon Dioxide	Test	burns with a pop	relights a glowing splint	turns lime water milky				
Gas	Hydrogen	Oxygen	Carbon Dioxide											
Test	burns with a pop	relights a glowing splint	turns lime water milky											
13a	$S + O_2 \rightarrow SO_2$	<p style="text-align: center;"> <math>S + O_2 \rightarrow SO_2</math>              sulphur is not a diatomic element      oxygen is a diatomic element      "DI" means straight to the formula           </p>												
13b	covalent	<table border="1"> <tr> <td>Elements in Substance</td> <td>Metals Only</td> <td>Non-metals Only</td> <td>Metals + non-metals</td> </tr> <tr> <td>Type of bonding</td> <td>Metallic</td> <td>Covalent</td> <td>Ionic</td> </tr> </table>	Elements in Substance	Metals Only	Non-metals Only	Metals + non-metals	Type of bonding	Metallic	Covalent	Ionic				
Elements in Substance	Metals Only	Non-metals Only	Metals + non-metals											
Type of bonding	Metallic	Covalent	Ionic											
13c	pH less than 7	<p>Sulphur dioxide dissolves in water to form an acid.</p> <table border="1"> <tr> <td>Acidic pH&lt;7</td> <td>Neutral pH=7</td> <td>Alkaline pH&gt;7</td> </tr> </table>	Acidic pH<7	Neutral pH=7	Alkaline pH>7									
Acidic pH<7	Neutral pH=7	Alkaline pH>7

Type of Drink	% Alcohol													
Beers	7.5%													
Red wine	12%													
Fortified Wines	18%													
Whisky	40%													
14b(i)	enzymes	Enzymes are biological catalysts found in living organisms which catalyses all the different chemical reactions which take place in the organism.												
14b(ii)	ethanol	<table border="1"> <tr> <td> <math>\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{OH} \\   \\ \text{H} \end{array}</math> </td> <td> <math>\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ \text{H}-\text{C}-\text{C}-\text{OH} \\   \quad   \\ \text{H} \quad \text{H} \end{array}</math> </td> <td> <math>\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{OH} \\   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \end{array}</math> </td> <td> <math>\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{C}-\text{OH} \\   \quad   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \end{array}</math> </td> </tr> </table>	$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{OH} \\   \\ \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ \text{H}-\text{C}-\text{C}-\text{OH} \\   \quad   \\ \text{H} \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{OH} \\   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{C}-\text{OH} \\   \quad   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \end{array}$								
$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{OH} \\   \\ \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ \text{H}-\text{C}-\text{C}-\text{OH} \\   \quad   \\ \text{H} \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{OH} \\   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \\   \quad   \quad   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{C}-\text{OH} \\   \quad   \quad   \quad   \\ \text{H} \quad \text{H} \quad \text{H} \quad \text{H} \end{array}$											

		methanol	ethanol	propanol	butanol																												
14b(iii)	turns lime water milky	Gas Test	Hydrogen burns with a pop	Oxygen relights a glowing splint	Carbon Dioxide turns lime water milky																												
15a	<div style="border: 1px solid black; padding: 2px; display: inline-block;">nitrogen</div> <div style="border: 1px solid black; padding: 2px; display: inline-block;">unreacted gases</div> <div style="border: 1px solid black; padding: 2px; display: inline-block; margin-left: 5px;">catalyst chamber</div> <div style="border: 1px solid black; padding: 2px; display: inline-block; margin-left: 100px;">ammonia</div>	Problem Solving: Transferring information from written passage into a flow chart																															
15b	Haber Process	Nitrogen + Hydrogen $\xrightarrow{\text{iron catalyst}}$ Ammonia																															
15c	air	Air contains 79% nitrogen and 21% oxygen																															
16a	neutralisation	acid + metal oxide $\longrightarrow$ salt + water sulphuric acid + copper oxide $\longrightarrow$ copper sulphate + water																															
16b	filtration	Excess copper oxide must be added to sulphuric acid to ensure all acid has been neutralised. As copper oxide is insoluble in water it can be removed from the solution by filtration.																															
16c	copper too unreactive	Copper, mercury, silver, gold and platinum are very unreactive and do not react with dilute acids.																															
17a(i)	nitrifying bacteria in root nodules	Nitrifying bacteria in root nodules of leguminous plants are able to fix nitrogen from the atmosphere into nitrate compounds. e.g. clover, pea family and bean family																															
17a(ii)	lightning	A spark is required to combine nitrogen and oxygen in air. The N $\equiv$ N triple bond requires a large amount of energy to break before it can join with oxygen.																															
17b	fertilisers must be soluble	Fertilisers are soluble compounds containing one or more of the elements: <div style="border: 1px solid black; padding: 5px; display: inline-block; margin: 5px;">             Nitrogen    Phosphorus    Potassium           </div>																															
17c	potassium																																
18a	alloys	Alloys are mixtures of metals or sometimes metals with non-metals in them: <div style="border: 1px solid black; padding: 2px; display: inline-block; margin: 2px;">             bronze    amalgam    stainless steel    steel    brass    cupronickel           </div>																															
18b	melting point decreases	Problem Solving: Interpreting data on a line graph																															
18c	210°C	<table border="1" style="width: 100%; border-collapse: collapse; text-align: center;"> <tr> <td>% Tin</td> <td>65%</td> <td>70%</td> <td>75%</td> <td>80%</td> <td>85%</td> <td>90%</td> </tr> <tr> <td>Melting Point</td> <td>185°C</td> <td>190°C</td> <td>195°C</td> <td>200°C</td> <td>-</td> <td>-</td> </tr> <tr> <td>Difference</td> <td style="background-color: #cccccc;"> </td> <td>5°C</td> <td>5°C</td> <td>5°C</td> <td>(5°C)</td> <td>(5°C)</td> </tr> <tr> <td>Estimate</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> <td>205°C</td> <td>210°C</td> </tr> </table>				% Tin	65%	70%	75%	80%	85%	90%	Melting Point	185°C	190°C	195°C	200°C	-	-	Difference		5°C	5°C	5°C	(5°C)	(5°C)	Estimate	-	-	-	-	205°C	210°C
% Tin	65%	70%	75%	80%	85%	90%																											
Melting Point	185°C	190°C	195°C	200°C	-	-																											
Difference		5°C	5°C	5°C	(5°C)	(5°C)																											
Estimate	-	-	-	-	205°C	210°C																											
19a(i)	aluminium oxide	Problem Solving: Analysis of information in a table																															
19a(ii)	transition metal	Iron, Titanium and chromium are all transition metals																															
19b	graphite	Carbon (graphite) is the only non-metal element which conduct electricity

15a	nitrogen unreacted catalyst gases chamber ammonia	Problem Solving: Transferring information from written passage into a flow chart																												
15b	Haber Process	Nitrogen + Hydrogen $\xrightarrow{\text{iron catalyst}}$ Ammonia																												
15c	air	Air contains 79% nitrogen and 21% oxygen																												
16a	neutralisation	$\text{acid} + \text{metal oxide} \longrightarrow \text{salt} + \text{water}$ $\text{sulphuric acid} + \text{copper oxide} \longrightarrow \text{copper sulphate} + \text{water}$																												
16b	filtration	Excess copper oxide must be added to the sulphuric acid to ensure all the acid has been neutralised. As copper oxide is insoluble in water it can be removed from the solution by filtration.																												
16c	copper too unreactive	Copper, mercury, silver, gold and platinum are too unreactive and do not react with dilute acids.																												
17a(i)	nitrifying bacteria in root nodules	Nitrifying bacteria in root nodules of leguminous plants are able to <i>fix</i> nitrogen from the atmosphere into nitrate compounds. e.g. clover, pea family and bean family																												
17a(ii)	lightning	A spark is required to combine nitrogen and oxygen in air. The N≡N triple bond requires a large amount of energy to break before it can join with oxygen.																												
17b	fertilisers must be soluble	Fertilisers are soluble compounds containing one or more of the elements:																												
17c	potassium	<table border="1"> <tbody> <tr> <td>Nitrogen</td> <td>Phosphorus</td> <td>Potassium</td> </tr> </tbody> </table>	Nitrogen	Phosphorus	Potassium																									
Nitrogen	Phosphorus	Potassium																												
18a	alloys	Alloys are mixtures of metals or sometimes metals with non-metals in them: <table border="1"> <tbody> <tr> <td>bronze</td> <td>amalgam</td> <td>stainless steel</td> <td>steel</td> <td>brass</td> <td>cupronickel</td> </tr> </tbody> </table>	bronze	amalgam	stainless steel	steel	brass	cupronickel																						
bronze	amalgam	stainless steel	steel	brass	cupronickel																									
18b	melting point decreases	Problem Solving: Interpreting data on a line graph																												
18c	210°C	<table border="1"> <tbody> <tr> <td>% Tin</td> <td>65%</td> <td>70%</td> <td>75%</td> <td>80%</td> <td>85%</td> <td>90%</td> </tr> <tr> <td>Melting Point</td> <td>185°C</td> <td>190°C</td> <td>195°C</td> <td>200°C</td> <td>-</td> <td>-</td> </tr> <tr> <td>Difference</td> <td></td> <td>5°C</td> <td>5°C</td> <td>5°C</td> <td>(5°C)</td> <td>(5°C)</td> </tr> <tr> <td>Estimate</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> <td>205°C</td> <td>210°C</td> </tr> </tbody> </table>	% Tin	65%	70%	75%	80%	85%	90%	Melting Point	185°C	190°C	195°C	200°C	-	-	Difference		5°C	5°C	5°C	(5°C)	(5°C)	Estimate	-	-	-	-	205°C	210°C
