# 2002 Int2 Chemistry Marking Scheme

MC Qu	Answer	% Pupils Correct	Reasoning															
1	A	87	<table border="1" style="width: 100%; border-collapse: collapse; margin: 5px 0;"> <tr> <th style="width: 20%;">Element</th> <th style="width: 20%;">Aluminium</th> <th style="width: 20%;">Hydrogen</th> <th style="width: 20%;">Iodine</th> <th style="width: 20%;">Magnesium</th> </tr> <tr> <td>Date of Discovery</td> <td>1825</td> <td>1766</td> <td>1811</td> <td>1808</td> </tr> </table>	Element	Aluminium	Hydrogen	Iodine	Magnesium	Date of Discovery	1825	1766	1811	1808					
Element	Aluminium	Hydrogen	Iodine	Magnesium														
Date of Discovery	1825	1766	1811	1808														
2	D	85	<input checked="" type="checkbox"/> A Nitrogen has the formula N <sub>2</sub> ∴ nitrogen is a diatomic molecule <input checked="" type="checkbox"/> B Oxygen has the formula O <sub>2</sub> ∴ oxygen is a diatomic molecule <input checked="" type="checkbox"/> C Fluorine has the formula F <sub>2</sub> ∴ fluorine is a diatomic molecule <input checked="" type="checkbox"/> D Neon is a Noble gas and has formula Ne ∴ Neon is not a diatomic molecule															
3	B	77	Number of neutrons = mass number - atomic number = 35-17 = 18															
4	B	74	<table border="1" style="width: 100%; border-collapse: collapse; margin: 5px 0;"> <tr> <th style="width: 25%;">Write down Formulae of ions</th> <th style="width: 25%;">Write down Valency below each ion</th> <th style="width: 25%;">Put in Cross-over Arrows</th> <th style="width: 25%;">Follow arrows and cancel down to get formula</th> </tr> <tr> <td style="text-align: center;">Mg SO<sub>3</sub><sup>2-</sup></td> <td style="text-align: center;">Mg SO<sub>3</sub><sup>2-</sup> 2      2</td> <td style="text-align: center;">Mg SO<sub>3</sub> </td> <td style="text-align: center; vertical-align: middle;">MgSO<sub>3</sub></td> </tr> </table>	Write down Formulae of ions	Write down Valency below each ion	Put in Cross-over Arrows	Follow arrows and cancel down to get formula	Mg SO <sub>3</sub> <sup>2-</sup>	Mg SO <sub>3</sub> <sup>2-</sup> 2      2	Mg SO <sub>3</sub> 	MgSO <sub>3</sub>							
Write down Formulae of ions	Write down Valency below each ion	Put in Cross-over Arrows	Follow arrows and cancel down to get formula															
Mg SO <sub>3</sub> <sup>2-</sup>	Mg SO <sub>3</sub> <sup>2-</sup> 2      2	Mg SO <sub>3</sub> 	MgSO <sub>3</sub>															
5	C	42	<table border="1" style="width: 100%; border-collapse: collapse; margin: 5px 0;"> <tr> <th style="width: 25%;">Write down Formulae</th> <th style="width: 25%;">Reverse crossover rule from formula</th> <th style="width: 25%;">Work out valency from cross over rule</th> <th style="width: 25%;">Ionic Formula</th> </tr> <tr> <td style="text-align: center;">CrCl<sub>3</sub></td> <td style="text-align: center;">Cr Cl </td> <td> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th style="width: 50%;">Element</th> <th style="width: 50%;">Valency</th> </tr> <tr> <td style="text-align: center;">Cr</td> <td style="text-align: center;">3</td> </tr> <tr> <td style="text-align: center;">Cl</td> <td style="text-align: center;">1</td> </tr> </table> </td> <td style="text-align: center; vertical-align: middle;">Cr<sup>3+</sup>(Cl<sup>-</sup>)<sub>3</sub></td> </tr> </table>	Write down Formulae	Reverse crossover rule from formula	Work out valency from cross over rule	Ionic Formula	CrCl <sub>3</sub>	Cr Cl 	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th style="width: 50%;">Element</th> <th style="width: 50%;">Valency</th> </tr> <tr> <td style="text-align: center;">Cr</td> <td style="text-align: center;">3</td> </tr> <tr> <td style="text-align: center;">Cl</td> <td style="text-align: center;">1</td> </tr> </table>	Element	Valency	Cr	3	Cl	1	Cr <sup>3+</sup> (Cl <sup>-</sup> ) <sub>3</sub>	
Write down Formulae	Reverse crossover rule from formula	Work out valency from cross over rule	Ionic Formula															
CrCl <sub>3</sub>	Cr Cl 	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <th style="width: 50%;">Element</th> <th style="width: 50%;">Valency</th> </tr> <tr> <td style="text-align: center;">Cr</td> <td style="text-align: center;">3</td> </tr> <tr> <td style="text-align: center;">Cl</td> <td style="text-align: center;">1</td> </tr> </table>	Element	Valency	Cr	3	Cl	1	Cr <sup>3+</sup> (Cl <sup>-</sup> ) <sub>3</sub>									
Element	Valency																	
Cr	3																	
Cl	1																	
6	D	67	<input checked="" type="checkbox"/> A Chlorine atoms have 17 electrons ∴ Chloride Cl <sup>-</sup> ions have 18 electrons <input checked="" type="checkbox"/> B Sulphur atoms have 16 electrons ∴ Sulphide S <sup>2-</sup> ions have 18 electrons <input checked="" type="checkbox"/> C Argon atoms have 18 electrons <input checked="" type="checkbox"/> D Sodium atoms have 11 electrons ∴ Sodium Na <sup>+</sup> ions have 10 electrons															
7	C	84	1 mol of (NH <sub>4</sub> ) <sub>2</sub> SO <sub>4</sub> = (2×14)+(8×1)+(1×32)+(4×16) = 28+8+32+64 = 132g															
8	C	31	<input checked="" type="checkbox"/> A negative ions are attracted to the negative electrode not positive ions <input checked="" type="checkbox"/> B neutral atoms are not attracted to the negative electrode <input checked="" type="checkbox"/> C negative Cl <sup>-</sup> ions lose electrons at the negative electrode and form Cl <sub>2</sub> molecules <input checked="" type="checkbox"/> D neutral atoms are not attracted to the negative electrode															
9	C	94	Fractional distillation separates chemicals with different boiling points. All the chemicals with similar boiling points evaporate off and are collected by condensing the vapours back into liquids.															
10	B	73	<input checked="" type="checkbox"/> A Molecule has formula C <sub>6</sub> H <sub>14</sub> and has a different formula from heptane C <sub>7</sub> H <sub>16</sub> <input checked="" type="checkbox"/> B Both molecules have formula C <sub>7</sub> H <sub>16</sub> but are isomers with different structures <input checked="" type="checkbox"/> C Molecule has formula C <sub>7</sub> H <sub>14</sub> and has a different formula from heptane C <sub>7</sub> H <sub>16</sub> <input checked="" type="checkbox"/> D Molecule has formula C <sub>7</sub> H <sub>14</sub> and has a different formula from heptane C <sub>7</sub> H <sub>16</sub>															
11	C	78	<table border="1" style="width: 100%; border-collapse: collapse; margin: 5px 0;"> <tr> <th style="width: 25%;">Substance</th> <th style="width: 12.5%;">A</th> <th style="width: 12.5%;">B</th> <th style="width: 12.5%;">C</th> <th style="width: 12.5%;">D</th> </tr> <tr> <td>Name</td> <td>propan-1-ol</td> <td>propan-2-ol</td> <td>butan-1-ol</td> <td>butan-2-ol</td> </tr> <tr> <td>Boiling Point (°C)</td> <td>97</td> <td>82</td> <td>118</td> <td>100</td> </tr> </table>	Substance	A	B	C	D	Name	propan-1-ol	propan-2-ol	butan-1-ol	butan-2-ol	Boiling Point (°C)	97	82	118	100
Substance	A	B	C	D														
Name	propan-1-ol	propan-2-ol	butan-1-ol	butan-2-ol														
Boiling Point (°C)	97	82	118	100														
12	B	87	<input checked="" type="checkbox"/> A in catalytic converters: carbon monoxide is turned into carbon dioxide <input checked="" type="checkbox"/> B in catalytic converters: carbon monoxide is turned into carbon dioxide <input checked="" type="checkbox"/> C in catalytic converters: nitrogen dioxide is turned back into nitrogen <input checked="" type="checkbox"/> D oxygen is not a harmful gas ∴ not reacted to get rid of in catalytic converter															

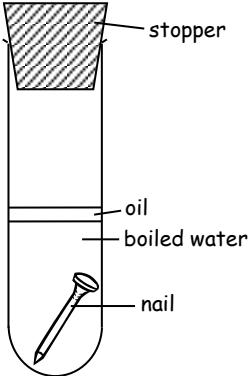

13	D	37	<input checked="" type="checkbox"/> A Sugars are not large enough to be classified as polymers <input checked="" type="checkbox"/> B Animal fats are not large enough to be classified as polymers <input checked="" type="checkbox"/> C Marine oils are not large enough to be classified as polymers <input checked="" type="checkbox"/> D Proteins are large polymers made up amino acid building blocks												
14	A	55	$\begin{array}{ccccccc} \text{starch} & + & \text{water} & \longrightarrow & \text{glucose} \\ (\text{C}_6\text{H}_{10}\text{O}_5)_n & + & n\text{H}_2\text{O} & \longrightarrow & n\text{C}_6\text{H}_{12}\text{O}_6 \end{array}$												
15	C	50	Fats/oils molecules can be hydrolysed into 1 molecule of glycerol and 3 molecules of fatty acid												
16	D	20	<input checked="" type="checkbox"/> A Test for Hydrogen: burns with a pop <input checked="" type="checkbox"/> B Test for Oxygen: relights a glowing splint <input checked="" type="checkbox"/> C Test for Carbon dioxide: turns lime water milky <input checked="" type="checkbox"/> D Test for Alkenes produced from cracking: rapidly decolourises bromine solution												
17	B	62	<table border="1"> <thead> <tr> <th>Action on Acid</th> <th>Effect on pH</th> <th>Effect on H<sup>+</sup> concentration</th> </tr> </thead> <tbody> <tr> <td>Dilution</td> <td>Increase to 7</td> <td>Decreases</td> </tr> </tbody> </table>	Action on Acid	Effect on pH	Effect on H <sup>+</sup> concentration	Dilution	Increase to 7	Decreases						
Action on Acid	Effect on pH	Effect on H <sup>+</sup> concentration													
Dilution	Increase to 7	Decreases													
18	A	65	<input checked="" type="checkbox"/> A ethanoic acid is a weak acid and has fewest ions ∴ lowest conductivity <input checked="" type="checkbox"/> B hydrochloric acid is a strong acid and has many ions ∴ higher conductivity <input checked="" type="checkbox"/> C nitric acid is a strong acid and has many ions ∴ higher conductivity <input checked="" type="checkbox"/> D sulphuric acid is a strong acid and has many ions ∴ higher conductivity												
19	D	67	Ammonia dissolves in water to form the weak alkali ammonium hydroxide ∴ pH > 7												
20	A	75	<table border="1"> <thead> <tr> <th>Type</th> <th>pH</th> <th>Ions in Solution</th> </tr> </thead> <tbody> <tr> <td>Acid</td> <td>pH &lt; 7</td> <td>Concentration of H<sup>+</sup> &gt; Concentration of OH<sup>-</sup></td> </tr> <tr> <td>Neutral e.g. pure water</td> <td>pH = 7</td> <td>Concentration of H<sup>+</sup> = Concentration of OH<sup>-</sup></td> </tr> <tr> <td>Alkali</td> <td>pH &gt; 7</td> <td>Concentration of OH<sup>-</sup> &gt; Concentration of H<sup>+</sup></td> </tr> </tbody> </table>	Type	pH	Ions in Solution	Acid	pH < 7	Concentration of H <sup>+</sup> > Concentration of OH <sup>-</sup>	Neutral e.g. pure water	pH = 7	Concentration of H <sup>+</sup> = Concentration of OH <sup>-</sup>	Alkali	pH > 7	Concentration of OH <sup>-</sup> > Concentration of H <sup>+</sup>
Type	pH	Ions in Solution													
Acid	pH < 7	Concentration of H <sup>+</sup> > Concentration of OH <sup>-</sup>													
Neutral e.g. pure water	pH = 7	Concentration of H <sup>+</sup> = Concentration of OH <sup>-</sup>													
Alkali	pH > 7	Concentration of OH <sup>-</sup> > Concentration of H <sup>+</sup>													
21	A	43	<p>A base is a chemical which neutralises an acid:</p> <p style="text-align: center;">Metal Hydroxide    Metal Oxide    Metal Carbonate (alkalis)</p>												
22	B	28	<input checked="" type="checkbox"/> A no of mol = volume × concentration = 0.1litres × 4mol l <sup>-1</sup> = 0.4mol <input checked="" type="checkbox"/> B no of mol = volume × concentration = 0.2litres × 3mol l <sup>-1</sup> = 0.6mol <input checked="" type="checkbox"/> C no of mol = volume × concentration = 0.3litres × 1mol l <sup>-1</sup> = 0.3mol <input checked="" type="checkbox"/> D no of mol = volume × concentration = 0.4litres × 0.5mol l <sup>-1</sup> = 0.2mol												
23	D	39	<input checked="" type="checkbox"/> A Calcium is too reactive: Calcium is made by molten electrolysis <input checked="" type="checkbox"/> B Copper is too reactive: Copper is made by heating copper ore with carbon <input checked="" type="checkbox"/> C Zinc is too reactive: Zinc is made by heating zinc ore with carbon <input checked="" type="checkbox"/> D Silver is unreactive and can be made by heating silver ores to release silver												
24	A	57	<input checked="" type="checkbox"/> A copper is not a reactive enough metal to react with dilute acid <input checked="" type="checkbox"/> B zinc + hydrochloric acid → zinc chloride + hydrogen <input checked="" type="checkbox"/> C copper carbonate + hydrochloric acid → copper chloride + water + carbon dioxide <input checked="" type="checkbox"/> D zinc carbonate + hydrochloric acid → zinc chloride + water + carbon dioxide												
25	A	54	<input checked="" type="checkbox"/> A copper hydroxide is insoluble (p8 data booklet) and forms a precipitate <input checked="" type="checkbox"/> B calcium chloride and copper bromide are both soluble (no precipitate formed) <input checked="" type="checkbox"/> C magnesium chloride and copper nitrate are both soluble (no precipitate formed) <input checked="" type="checkbox"/> D lithium chloride and copper sulphate are both soluble (no precipitate formed)												

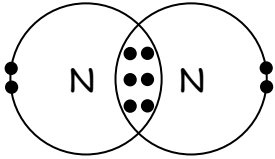

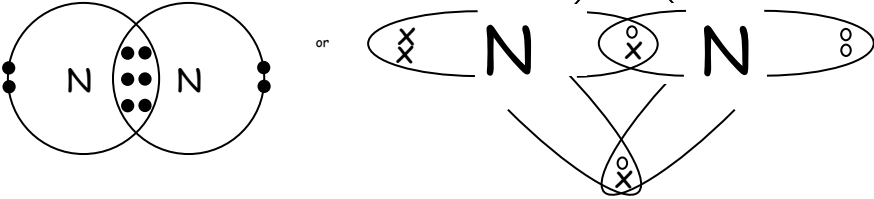

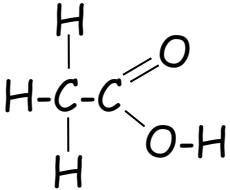

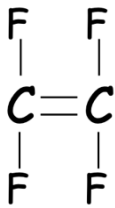

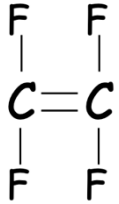

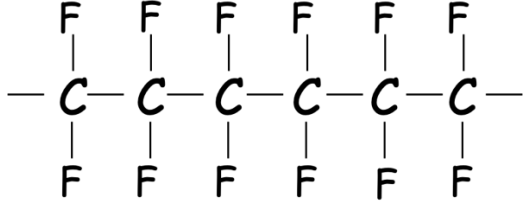

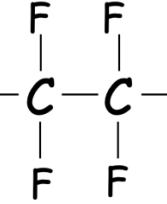

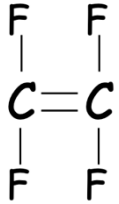

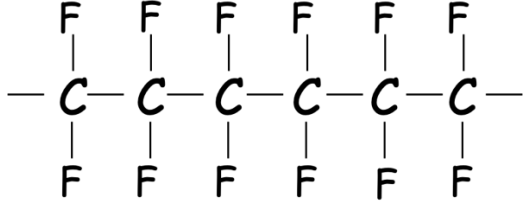

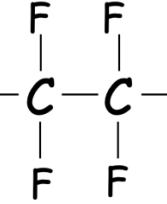

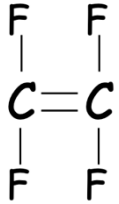

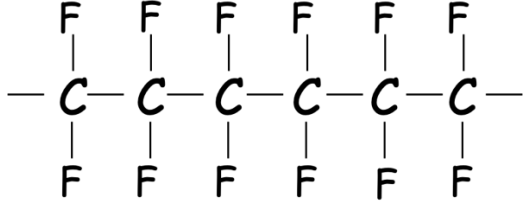

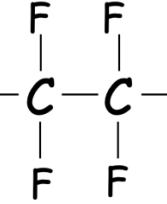

## Questions 26 and 27 are Grid Questions.

- This style of question was dropped after the 2002 Int2 exam.
- The style of question is no longer used but the content of the question can still be asked in future exams.

26a	<b>B</b> (1 mark)	The high energy spark in a petrol engine to ignite the petrol/air mixture. This energy is enough to split the N≡N triple bond in N <sub>2</sub> molecules and forms nitrogen dioxide: $N_2 + 2O_2 \rightarrow 2NO_2$
26b	<b>C+D</b> (both for 1 mark)	<input checked="" type="checkbox"/> A pure water has pH=7 <input checked="" type="checkbox"/> B non-metal oxides dissolve in water to form acids <input checked="" type="checkbox"/> C metal oxides dissolve in water to form alkalis <input checked="" type="checkbox"/> D metal oxides dissolve in water to form alkalis <input checked="" type="checkbox"/> E carbon monoxide is insoluble in water so is pH neutral <input checked="" type="checkbox"/> F non-metal oxides dissolve in water to form acids
26c	<b>A+E</b> (both for 1 mark)	<input checked="" type="checkbox"/> A hydrogen in hydrocarbons burns to form water <input checked="" type="checkbox"/> B hydrocarbons contain no nitrogen so burning does not form nitrogen dioxide <input checked="" type="checkbox"/> C hydrocarbons contain no potassium so burning does not form potassium oxide <input checked="" type="checkbox"/> D hydrocarbons contain no calcium so burning does not form calcium oxide <input checked="" type="checkbox"/> E Incomplete combustion of hydrocarbons forms carbon monoxide <input checked="" type="checkbox"/> F hydrocarbons contain no sulphur so burning does not form sulphur dioxide
27	<b>B,E</b> (1 mark each)	<input checked="" type="checkbox"/> A Isotopes have same number of protons but different number of neutrons <input checked="" type="checkbox"/> B Isotopes have same number of protons but different number of neutrons <input checked="" type="checkbox"/> C different isotopes of silver have different mass numbers ( <sup>107</sup> Ag and <sup>109</sup> Ag) <input checked="" type="checkbox"/> D Equal numbers of <sup>107</sup> Ag and <sup>109</sup> Ag isotopes due to relative atomic mass = 108 <input checked="" type="checkbox"/> E In neutral atoms: no. of electrons = no. of protons = atomic number = 47

		Write down Formulae of elements	Write down Valency below each atom	Put in Cross-over Arrows	Follow arrows to get formula													
Ba    Cl	Ba    Cl  2      1	Ba    Cl /  \ /  \ 2      1	BaCl <sub>2</sub>															
1b(i)	gas	1560°C																
	liquid	963°C																
	solid																	
1b(ii)	Solid	At 900°C, Barium chloride has yet to melt (m.pt. = 961°C) Barium chloride must still be a solid at 900°C																
2a	CSi or SiC	There are equal numbers of Si atoms and C atoms: ratio of Si:C is 1:1 ∴ formula SiC																
2b(i)	Covalent bonding or electrons not free to move in silica	Silica is made of silicon and oxygen bonded together with formula SiO <sub>2</sub> .																
		<ul style="list-style-type: none"> <li>• Compounds containing only non-metals have covalent bonding</li> <li>• Covalent compounds do not conduct electricity in any state</li> </ul>																
		<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 20%;">Bonding</th> <th style="width: 15%;">Solid</th> <th style="width: 15%;">Liquid</th> <th style="width: 15%;">Solution</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">Metallic <small>(metals only)</small></td> <td style="text-align: center;">✓</td> <td style="text-align: center;">✓</td> <td style="text-align: center;">-</td> </tr> <tr> <td style="text-align: center;">Covalent <small>(non-metals only)</small></td> <td style="text-align: center;">x</td> <td style="text-align: center;">x</td> <td style="text-align: center;">x</td> </tr> <tr> <td style="text-align: center;">Ionic <small>(metals + non-metals)</small></td> <td style="text-align: center;">x</td> <td style="text-align: center;">✓</td> <td style="text-align: center;">✓</td> </tr> </tbody> </table>	Bonding	Solid	Liquid	Solution	Metallic <small>(metals only)</small>	✓	✓	-	Covalent <small>(non-metals only)</small>	x	x	x	Ionic <small>(metals + non-metals)</small>	x	✓	✓
Bonding	Solid	Liquid	Solution															
Metallic <small>(metals only)</small>	✓	✓	-															
Covalent <small>(non-metals only)</small>	x	x	x															
Ionic <small>(metals + non-metals)</small>	x	✓	✓															
2b(ii)	Covalent bonds must be broken to melt covalent network substance	Silica is a covalent network substance due to the strong covalent bonds between atoms. To melt a covalent network, all covalent bonds must be broken. This requires a great deal of energy ∴ high melting point																
3a	$Fe \rightarrow Fe^{2+} + 2e^{-}$	Iron atoms oxidise (lose electrons) to become Fe <sup>2+</sup> ions and further oxidise to become Fe <sup>3+</sup> ions during the process of rusting.																
3b	Ferroxyl Indicator	Ferroxyl indicator turns blue in the presence of Fe <sup>2+</sup> ions Ferroxyl indicator turns pink in the presence of OH <sup>-</sup> ions																
3c		Boiling water removes dissolved air from the water. Adding a layer of oil on top of the boiling water prevents air dissolving back into the water again.																
4a	$C_4H_{10} + 13N_2O$ $\downarrow$ $4CO_2 + 5H_2O + 13N_2$	$C_4H_{10} + 13N_2O \longrightarrow 4CO_2 + 5H_2O + 13N_2$																

4b																						
5a	D → C → A → B	<table border="1"> <thead> <tr> <th>Order</th> <th>Letter</th> <th>Name</th> <th>Reasoning</th> </tr> </thead> <tbody> <tr> <td>1<sup>st</sup></td> <td>D</td> <td>Steam Generator</td> <td>Steam must be made and transferred to C</td> </tr> <tr> <td>2<sup>nd</sup></td> <td>C</td> <td>Oil Extraction</td> <td>Lavender oil vapour is extracted from leaves</td> </tr> <tr> <td>3<sup>rd</sup></td> <td>A</td> <td>Condensation</td> <td>Lavender oil vapour is condensed back to liquid</td> </tr> <tr> <td>4<sup>th</sup></td> <td>B</td> <td>Oil Collection</td> <td>Lavender oil liquid collects in beaker</td> </tr> </tbody> </table>	Order	Letter	Name	Reasoning	1 <sup>st</sup>	D	Steam Generator	Steam must be made and transferred to C	2 <sup>nd</sup>	C	Oil Extraction	Lavender oil vapour is extracted from leaves	3 <sup>rd</sup>	A	Condensation	Lavender oil vapour is condensed back to liquid	4 <sup>th</sup>	B	Oil Collection	Lavender oil liquid collects in beaker
Order	Letter	Name	Reasoning																			
1 <sup>st</sup>	D	Steam Generator	Steam must be made and transferred to C																			
2 <sup>nd</sup>	C	Oil Extraction	Lavender oil vapour is extracted from leaves																			
3 <sup>rd</sup>	A	Condensation	Lavender oil vapour is condensed back to liquid																			
4 <sup>th</sup>	B	Oil Collection	Lavender oil liquid collects in beaker																			
5b(i)	Wear gloves or react bromine spillage with thiosulphate solution	PPA Safety Question																				
5b(ii)	-O-H	Alcohols contain the hydroxyl -OH functional group																				
5b(iii)	ester	Condensation Reaction: Alcohol + Carboxylic Acid → Ester + Water																				
5b(iv)		Ethanoic acid has two carbons and a carboxyl -COOH functional group																				
6a	Rods should be cleaned and dried	PPA Technique Question																				
6b	Any two from:	Same electrolyte concentration, Same electrolyte compound Same electrolyte volume Depth of rods in solution Same temperature																				
6c	Voltage above 0.5V e.g. 0.7V	The further apart metals are from each other on the electrochemical series, the higher the voltage of the cell. A zinc is further from copper than iron is from copper, the zinc-copper cell will have a high voltage than an iron-copper cell																				
7a	acid rain or nitric acid	Non-metal oxides dissolve in water to form acids e.g. sulphur dioxide, nitrogen dioxide and carbon dioxide																				
7b	Neutralisation	acid + metal hydroxide (alkali) → salt + water acid + metal oxide → salt + water acid + metal carbonate → salt + water + carbon dioxide																				
7c		<table border="1"> <tbody> <tr> <td data-bbox="557 1749 715 1951">  </td> <td data-bbox="715 1749 1283 1951">  </td> <td data-bbox="1283 1749 1495 1951">  </td> </tr> <tr> <td data-bbox="557 1951 715 1982">Monomer</td> <td data-bbox="715 1951 1283 1982">Polymer</td> <td data-bbox="1283 1951 1495 1982">Repeating Unit</td> </tr> </tbody> </table>				Monomer	Polymer	Repeating Unit														
																						
Monomer	Polymer	Repeating Unit																				

8a	Filtration	Filtration: Insoluble solid is removed from a liquid										
8b	Carbon Dioxide $\text{CO}_2$ or Ammonia $\text{NH}_3$	Carbon dioxide is produced by heating $\text{NaHCO}_3$ (bottom right corner) and is recycled to back into the Solvay Reactor (top left) Ammonia is released in the Reactor and goes back into the Solvay Process (middle left side)										
8c	Calcium chloride $\text{CaCl}_2$	Calcium Chloride is the product from the Reactor										
8d	0.0448	<p><math>\text{HCl}</math> no. of mol = volume x concentration = <math>0.0224 \text{ litres} \times 0.1 \text{ mol l}^{-1} = 0.00224 \text{ mol}</math></p> $\text{Na}_2\text{CO}_3 + 2\text{HCl} \longrightarrow 2\text{NaCl} + \text{CO}_2 + \text{H}_2\text{O}$ <p style="text-align: center;"> <math>\begin{matrix} 1\text{mol} &amp; 2\text{mol} \\ 0.00112\text{mol} &amp; 0.00224\text{mol} \end{matrix}</math> </p> <p style="text-align: center;"> <math>\text{concentration} = \frac{\text{no. of mol}}{\text{volume}} = \frac{0.00112 \text{ mol}}{0.025 \text{ litres}} = 0.0448 \text{ mol l}^{-1}</math> </p>										
9a	$\text{S}_2\text{O}_3^{2-} + 2\text{H}^+$ $\downarrow$ $\text{S} + \text{SO}_2 + \text{H}_2\text{O}$	$(\text{Na}^+)_2\text{S}_2\text{O}_3^{2-} + 2\text{H}^+\text{Cl}^- \rightarrow 2\text{Na}^+\text{Cl}^- + \text{S} + \text{SO}_2 + \text{H}_2\text{O}$ <p style="text-align: center;">Split up compounds into separate ions</p> $2\text{Na}^+ + \text{S}_2\text{O}_3^{2-} + 2\text{H}^+ + 2\text{Cl}^- \rightarrow 2\text{Na}^+ + 2\text{Cl}^- + \text{S} + \text{SO}_2 + \text{H}_2\text{O}$ <p style="text-align: center;">Cancel out any spectator ions which appear on both sides</p> $\cancel{2\text{Na}^+} + \text{S}_2\text{O}_3^{2-} + 2\text{H}^+ + \cancel{2\text{Cl}^-} \rightarrow \cancel{2\text{Na}^+} + \cancel{2\text{Cl}^-} + \text{S} + \text{SO}_2 + \text{H}_2\text{O}$ <p style="text-align: center;">Re-write equation omitting spectator ions</p> $\text{S}_2\text{O}_3^{2-} + 2\text{H}^+ \rightarrow \text{S} + \text{SO}_2 + \text{H}_2\text{O}$										
9b(i)	When X on paper disappears, stop timing	PPA 1.2 Question The "X" on the paper allows the observer to accurately judge the end-point of the reaction consistently as long as the same "X" and same observer are used.										
9b(ii)	$\text{SO}_2$ produced is a harmful gas	PPA 1.2 Question Sulphur dioxide is a toxic gas released in small quantities during the reaction.										
9c(i)	50	From graph: if concentration = $0.1 \text{ mol l}^{-1}$ then rate = $0.02\text{s}^{-1}$ $\text{rate} = \frac{1}{\text{time}} \quad \text{time} = \frac{1}{\text{rate}} = \frac{1}{0.02} = 50\text{s}$										
9c(ii)	Increased concentration increases the no. of collisions increasing reaction rate	The reaction rate is dependent on the number of successful collisions between reactants. Increasing concentration of reactants makes the likelihood of a successful collision more likely.										
10a	High strength	Kevlar is a extremely strong, lightweight plastic used in bullet-proof vests										
10b	2 functional groups on each monomer	For a monomer to become a large condensation polymer, the monomers must have 2 functional groups each. If the monomer only had 1 functional group, the polymer would no longer be able to extend any further.										
10c	$\begin{array}{c} \text{O} \quad \text{H} \\    \quad   \\ -\text{C} - \text{N}- \end{array}$	<p style="text-align: center;">condensation polymerisation</p> $\text{---NH---C}_6\text{H}_4\text{---NH---CO---C}_6\text{H}_4\text{---CO---NH---C}_6\text{H}_4\text{---NH---}$

Name	Alkali Metals	Halogens	Noble gases	Transition Metals								
Location	Group 1	Group 7	Group 0	Between Group 2 + 3								

11a(i)	Reaction is Exothermic	Reactants have more energy than the products. During a chemical reaction, the energy not transferred from the reactants to the products is released as heat energy. This is an exothermic reaction.																				
11a(ii)	Only partial dissociation of H <sup>+</sup> ions	Strong Acid: full dissociation of molecules to form H <sup>+</sup> ions Weak Acid: partial dissociation of molecules to form H <sup>+</sup> ions																				
12a(i)	Alkenes	Alkenes are a homologous series with a C=C double bond and general formula of C <sub>n</sub> H <sub>2n</sub>																				
12a(ii)	Addition	Addition Reactions: Molecules are added across a C=C double bond																				
12b	605g	$\text{gfm } C_3H_6 = (3 \times 12) + (6 \times 1) = 36 + 6 = 42\text{g}$ $\text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{100}{42} = 2.38\text{mol}$ $I_2 + C_3H_6 \longrightarrow C_3H_6I_2$ $\begin{array}{ccc} 1\text{mol} & & 1\text{mol} \\ 2.38\text{mol} & & 2.38\text{mol} \end{array}$ $\text{gfm } I_2 = (2 \times 127) = 254\text{g}$ $\text{mass} = \text{no. of mol} \times \text{gfm} = 2.38 \times 254 = 605\text{g}$																				
12c	Oils have more C=C double bonds than fats	The number of C=C double bonds in a fat/oil is directly linked to the number of I <sub>2</sub> molecules it will react with. Oils have more C=C double bonds than fats.																				
12d	heterogeneous	<table border="1"> <thead> <tr> <th>Type of Catalyst</th> <th>Definition</th> </tr> </thead> <tbody> <tr> <td>Homogeneous</td> <td>Catalyst in same state as reactants</td> </tr> <tr> <td>Heterogeneous</td> <td>Catalyst in different state from reactants</td> </tr> </tbody> </table>	Type of Catalyst	Definition	Homogeneous	Catalyst in same state as reactants	Heterogeneous	Catalyst in different state from reactants														
Type of Catalyst	Definition																					
Homogeneous	Catalyst in same state as reactants																					
Heterogeneous	Catalyst in different state from reactants																					
13a	31.9	$\text{no. of mol} = \text{volume} \times \text{concentration} = 0.4\text{litres} \times 0.50\text{mol l}^{-1} = 0.2\text{ mol}$ $\text{mass} = \text{no. of mol} \times \text{gfm} = 0.2\text{mol} \times 159.5\text{g mol}^{-1} = 31.9\text{g}$																				
13b(i)	Zn + Cu <sup>2+</sup> → Zn <sup>2+</sup> + Cu	$Zn \longrightarrow Zn^{2+} + 2e^{-}$ $Cu^{2+} + 2e^{-} \longrightarrow Cu$ <p>Add together equations cancelling out electrons</p> $Zn + Cu^{2+} \longrightarrow Zn^{2+} + Cu$																				
13b(ii)	0.0015	$\text{Rate} = \frac{\Delta\text{quantity}}{\Delta\text{time}} = \frac{0.50 - 0.41}{60 - 0} = \frac{0.09}{60} = 0.0015\text{ mol l}^{-1}\text{ s}^{-1}$																				
14a	Longer the chain the higher the critical temp	<table border="1"> <thead> <tr> <th>Alkane</th> <th>Propane</th> <th>Butane</th> <th>Pentane</th> <th>Hexane</th> </tr> </thead> <tbody> <tr> <td>Critical Temp</td> <td>97°C</td> <td>152°C</td> <td>197°C</td> <td>234°C</td> </tr> </tbody> </table>	Alkane	Propane	Butane	Pentane	Hexane	Critical Temp	97°C	152°C	197°C	234°C
