4a(i)	25	Problem Solving: Reading information from a graph										
4a(ii)	1.5	$25\% \text{ of } 6\text{g} = \frac{25}{100} \times 6 = 1.5\text{g}$										

4b	1.24	<p>gfm Ag = 108g</p> $\text{no of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{1.08}{108} = 0.01 \text{ mol}$ $4\text{Ag} + 2\text{H}_2\text{S} + \text{O}_2 \longrightarrow 2\text{Ag}_2\text{S} + 2\text{H}_2\text{O}$ <p style="margin-left: 40px;"> 4mol 2mol </p> <p style="margin-left: 40px;"> 2mol 1mol </p> <p style="margin-left: 40px;"> 0.01mol 0.005mol </p> <p>gfm Ag₂S = (2×108)+(1×32) = 216+32 = 248</p> <p>mass = no. of mol × gfm = 0.005 × 248 = 1.24g</p>																								
5a	Heat catalyst then heat paraffin	The catalyst must be at a high temperature before it will work efficiently. The Bunsen burner initially heats only the catalyst and when it is hot the Bunsen burner is then moved under the paraffin with the heating shared between the paraffin and the catalyst to keep both warm.																								
5b	To prevent suck-back	When the test tube is heated, the air inside expands and bubbles leave the delivery tube. When heating is stopped, the air inside contracts back to its original size but gas cannot re-enter the delivery tube so liquid is sucked up instead. Cold liquid can cause hot glass to crack.																								
5c(i)	aluminium oxide	Aluminium oxide is the catalyst in a cracking reaction. Silicate can also be used as the catalyst in this reaction.																								
5c(ii)	Lowers temperature cracking takes place	Catalyst are used to speed up reactions and are not used up in the reaction. Catalyst can be used to lower the temperature a reaction takes place at, often for safety reasons.

7a(i)	Fermentation	$ \text{glucose} \xrightarrow[\text{(no air)}]{\text{enzymes}} \text{alcohol} + \text{carbon dioxide} $ $ \text{C}_6\text{H}_{12}\text{O}_6 \longrightarrow 2\text{C}_2\text{H}_5\text{OH} + 2\text{CO}_2 $																								
7a(ii)	Enzymes	Enzymes are biological catalysts which catalyse the chemical reactions in living organisms at body temperature																								
7b	Enzymes denature at higher temperatures	Enzymes will change shape permanently and denature when temperatures are too high. Once denatured, enzymes no longer catalyse reactions.																								

7c	Distillation	Distillation separates chemicals with different boiling points. Ethanol boils at 78°C and water boils at 100°C. If the temperature is set between 78°C and 100°C, the ethanol will boil but the water will remain in the container.
