# 2014 Int2 Chemistry Marking Scheme

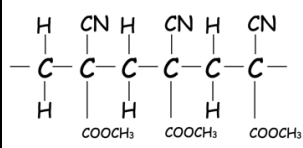

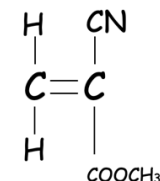

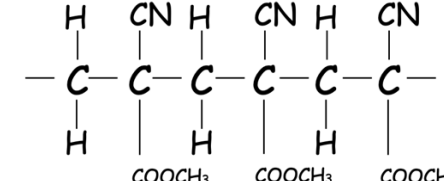

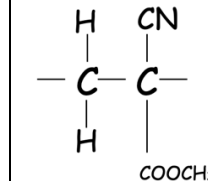

MC Qu	Answer	% Pupils Correct	Reasoning
1	D	84	<input checked="" type="checkbox"/> A Aluminium is in the block between groups 2 & 3 and is a transition metal <input checked="" type="checkbox"/> B Calcium is in group 2 and is an Alkaline Earth Metal <input checked="" type="checkbox"/> C Copper is in the block between groups 2 & 3 and is a transition metal <input checked="" type="checkbox"/> D Sodium is in group 1 and is an Alkali Metal
2	A	76	<input checked="" type="checkbox"/> A water is the liquid which does the dissolving ∴ water is the solvent <input checked="" type="checkbox"/> B sugar is a solid which is dissolved ∴ sugar is a solute <input checked="" type="checkbox"/> C lemon juice is a liquid which is dissolved ∴ lemon juice is a solute <input checked="" type="checkbox"/> D carbon dioxide is a gas which is dissolved ∴ carbon dioxide is a solute
3	B	39	<input checked="" type="checkbox"/> A Products are higher on diagram ∴ have more energy than reactants <input checked="" type="checkbox"/> B diagram shown is an endothermic reaction and the temperature will fall <input checked="" type="checkbox"/> C diagram shown is an endothermic reaction and heat is absorbed from surroundings <input checked="" type="checkbox"/> D diagram shown is an endothermic reaction as products are higher than reactants
4	B	97	<input checked="" type="checkbox"/> A Carbohydrate is a food group made from carbon, hydrogen and oxygen <input checked="" type="checkbox"/> B Enzymes are proteins which act as biological catalyst in living organisms <input checked="" type="checkbox"/> C Sugars is a food group made from carbon, hydrogen and oxygen <input checked="" type="checkbox"/> D Fats is a food group made from carbon, hydrogen and oxygen
5	D	92	<input checked="" type="checkbox"/> A Electron arrangement 2,4 = carbon ∴ group 4 element <input checked="" type="checkbox"/> B Electron arrangement 2,5 = nitrogen ∴ group 5 element <input checked="" type="checkbox"/> C Electron arrangement 2,6 = oxygen ∴ group 6 element <input checked="" type="checkbox"/> D Electron arrangement 2,7 = fluorine ∴ group 7 element ∴ element is a halogen
6	A	54	Phosphate $\text{PO}_4^{3-}$ is listed in data booklet page 8 ∴ Total negative charge in $\text{Zn}_3(\text{PO}_4)_2$ formula is 6- as there are two phosphate ions All ionic compounds are neutral over all so the total positive charge must be 6+ ∴ Total positive charge in 3 zinc ions = 6+ ∴ Positive charge on zinc ion = $6+/3 = 2+$
7	B	47	<input checked="" type="checkbox"/> A Covalent Molecular: does not conduct as solid or liquid and has low bpt <input checked="" type="checkbox"/> B Covalent Network: does not conduct as solid or liquid and has high mpt <input checked="" type="checkbox"/> C Ionic: Does not conduct as solid but does conduct as a liquid <input checked="" type="checkbox"/> D Metallic: Conducts as both as a solid and as a liquid
8	A	56	<input checked="" type="checkbox"/> A $\text{H}^+$ ions move to the negative electrode and form $\text{H}_2$ gas <input checked="" type="checkbox"/> B $\text{H}_2$ is formed in the reaction at the -ve electrode but not present at the start <input checked="" type="checkbox"/> C $\text{Cl}^-$ ions move to the positive electrode and form $\text{Cl}_2$ gas <input checked="" type="checkbox"/> D $\text{Cl}_2$ is formed in the reaction at the +ve electrode but not present at the start
9	C	90	$\text{Fe}_2\text{O}_3 + \text{CO} \rightarrow \text{Fe} + \text{CO}_2$ Fe: 2xFe before arrow but 1xFe after arrow ∴ double Fe after arrow $\text{Fe}_2\text{O}_3 + \text{CO} \rightarrow 2\text{Fe} + \text{CO}_2$ O: 4xO before arrow but 2xO after arrow ∴ double $\text{CO}_2$ after arrow $\text{Fe}_2\text{O}_3 + \text{CO} \rightarrow 2\text{Fe} + 2\text{CO}_2$ C: 1xC before arrow but 2xC after arrow ∴ double CO before arrow $\text{Fe}_2\text{O}_3 + 2\text{CO} \rightarrow 2\text{Fe} + 2\text{CO}_2$ O: 5xO before arrow but 4xO after arrow ∴ increase CO to 3 before arrow $\text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 2\text{Fe} + 2\text{CO}_2$ C: 3xC before arrow but 2xFe after arrow ∴ increase $\text{CO}_2$ to 3 after arrow $\text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 2\text{Fe} + 3\text{CO}_2$

10	C	81	<input checked="" type="checkbox"/> A 1mol CH <sub>4</sub> = (1×12)+(4×1) = 12+4 = 16g ∴ 0.5mol = 8g <input checked="" type="checkbox"/> B 1mol CO <sub>2</sub> = (1×12)+(2×16) = 12+32 = 44g ∴ 0.5mol = 22g <input checked="" type="checkbox"/> C 1mol NO <sub>2</sub> = (1×14)+(2×16) = 14+32 = 46g ∴ 0.5mol = 23g <input checked="" type="checkbox"/> D 1mol NH <sub>3</sub> = (1×14)+(3×1) = 14+3 = 17g ∴ 0.5mol = 8.5g						
11	B	92	<input checked="" type="checkbox"/> A carbon monoxide is a poisonous gas and must not be formed by the converter <input checked="" type="checkbox"/> B carbon monoxide is a poisonous gas which is converted into carbon dioxide <input checked="" type="checkbox"/> C nitrogen monoxide is a poisonous gas and must not be formed by the converter <input checked="" type="checkbox"/> D oxygen is a harmless gas and there is no need for the converter to remove it						
12	C	45	<input checked="" type="checkbox"/> A nitrogen compound formed comes from nitrogen in compound being burned <input checked="" type="checkbox"/> B hydrogen compound formed comes from hydrogen in compound being burned <input checked="" type="checkbox"/> C compounds of nitrogen, hydrogen and carbon formed mean all three must be in compound being burned <input checked="" type="checkbox"/> D oxygen could have come from the air that the compound was burned in						
13	A	75	<p>A carboxylic acid can be identified from the carboxyl group (-COOH) and '-oic' name ending.</p> <table border="1" style="width: 100%; text-align: center;"> <thead> <tr> <th style="padding: 5px;">methanoic acid</th> <th style="padding: 5px;">ethanoic acid</th> <th style="padding: 5px;">propanoic acid</th> </tr> </thead> <tbody> <tr> <td style="padding: 10px;"> <math display="block">\begin{array}{c} \text{O} \\ \parallel \\ \text{H}-\text{C} \\ \backslash \\ \text{OH} \end{array}</math> </td> <td style="padding: 10px;"> <math display="block">\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{C} \\   \quad \parallel \\ \text{H} \quad \text{OH} \end{array}</math> </td> <td style="padding: 10px;"> <math display="block">\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C} \\   \quad   \quad \parallel \\ \text{H} \quad \text{H} \quad \text{OH} \end{array}</math> </td> </tr> </tbody> </table>	methanoic acid	ethanoic acid	propanoic acid	$\begin{array}{c} \text{O} \\ \parallel \\ \text{H}-\text{C} \\ \backslash \\ \text{OH} \end{array}$	$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{C} \\   \quad \parallel \\ \text{H} \quad \text{OH} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C} \\   \quad   \quad \parallel \\ \text{H} \quad \text{H} \quad \text{OH} \end{array}$
methanoic acid	ethanoic acid	propanoic acid							
$\begin{array}{c} \text{O} \\ \parallel \\ \text{H}-\text{C} \\ \backslash \\ \text{OH} \end{array}$	$\begin{array}{c} \text{H} \\   \\ \text{H}-\text{C}-\text{C} \\   \quad \parallel \\ \text{H} \quad \text{OH} \end{array}$	$\begin{array}{c} \text{H} \quad \text{H} \\   \quad   \\ \text{H}-\text{C}-\text{C}-\text{C} \\   \quad   \quad \parallel \\ \text{H} \quad \text{H} \quad \text{OH} \end{array}$							
14	B	42	<input checked="" type="checkbox"/> A reaction would form 1-bromobutane and 2-bromobutane <input checked="" type="checkbox"/> B reaction would form 2-bromobutane <i>only</i> <input checked="" type="checkbox"/> C reaction would form 1-bromopentane and 2-bromopentane <input checked="" type="checkbox"/> D reaction would form 2-bromobutane and 3-bromobutane						
15	C	81	<input checked="" type="checkbox"/> A addition: molecule added across a C=C double bond <input checked="" type="checkbox"/> B cracking: bigger saturated molecules break down into smaller unsaturated molecules <input checked="" type="checkbox"/> C distillation: separation of molecules with different boiling points <input checked="" type="checkbox"/> D hydrolysis: splitting polymers into smaller monomers with water added at the break						
16	D	74	<input checked="" type="checkbox"/> A polyethene is a synthetic polymer as it is not found in nature <input checked="" type="checkbox"/> B polyethene is a synthetic polymer as it is not found in nature <input checked="" type="checkbox"/> C polyethene is a thermoplastic polymer as it reshapes on heating <input checked="" type="checkbox"/> D polyethene is synthetic polymer which is thermoplastic						
17	B	60	<input checked="" type="checkbox"/> A fructose is not the monomer to make starch by condensation polymerisation. <input checked="" type="checkbox"/> B starch is made by the condensation polymerisation of glucose monomer units <input checked="" type="checkbox"/> C starch is made by condensation where H <sub>2</sub> O is removed as the monomers join up <input checked="" type="checkbox"/> D starch is made by condensation where H <sub>2</sub> O is removed as the monomers join up						
18	C	74	<input checked="" type="checkbox"/> A Glucose turns Benedict's solution blue→brick red <input checked="" type="checkbox"/> B Maltose turns Benedict's solution blue→brick red <input checked="" type="checkbox"/> C Sucrose does not react with either iodine solution or Benedict's solution <input checked="" type="checkbox"/> D Starch turns iodine solution yellow→blue/black						
19	C	77	<input checked="" type="checkbox"/> A Esters are made from an alcohol and a carboxylic acid joining together <input checked="" type="checkbox"/> B Fats are made from glycerol and three fatty acids joining together <input checked="" type="checkbox"/> C Proteins are made from amino acid joining together <input checked="" type="checkbox"/> D Starch is made from glucose molecules joining together						
20	C	79	<input checked="" type="checkbox"/> A All aqueous solutions contain both hydrogen and hydroxide solutions <input checked="" type="checkbox"/> B All aqueous solutions contain both hydrogen and hydroxide solutions <input checked="" type="checkbox"/> C Acids contain more hydrogen ions than hydroxide ions <input checked="" type="checkbox"/> D Alkalis contain more hydroxide ions than hydrogen ions						
21	B	63	<input checked="" type="checkbox"/> A Ammonia solution is a weak alkali and typically gives a pH of around pH=11 <input checked="" type="checkbox"/> B Sodium hydroxide is a strong alkali and 0.1mol l <sup>-1</sup> NaOH(aq) has a pH=13 <input checked="" type="checkbox"/> C ethanoic acid is acidic and would give an acidic pH below pH=7 <input checked="" type="checkbox"/> D hydrochloric acid is acidic and would give an acidic pH below pH=7						

22	A	68	<input checked="" type="checkbox"/> A calcium oxide is a soluble metal oxide which dissolves to form an alkali <input checked="" type="checkbox"/> B nickel oxide is a non-soluble metal oxide so has no effect on pH <input checked="" type="checkbox"/> C nitrogen dioxide is a soluble non-metal oxide and dissolves to form an acid <input checked="" type="checkbox"/> D sulphur dioxide is a soluble non-metal oxide and dissolves to form an acid																																																								
23	B	56	<input checked="" type="checkbox"/> A no gas produced: magnesium hydroxide + hydrochloric acid → magnesium chloride + water <input checked="" type="checkbox"/> B CO <sub>2</sub> produced: magnesium carbonate + hydrochloric acid → magnesium chloride + water + CO <sub>2</sub> <input checked="" type="checkbox"/> C no gas produced: magnesium oxide + hydrochloric acid → magnesium chloride + water <input checked="" type="checkbox"/> D flammable gas produced: magnesium + hydrochloric acid → magnesium chloride + hydrogen																																																								
24	D	57	<input checked="" type="checkbox"/> A sodium nitrate is suitable as a fertiliser as it is soluble and contains nitrogen <input checked="" type="checkbox"/> B ammonium nitrate is suitable as a fertiliser as it is soluble and contains nitrogen <input checked="" type="checkbox"/> C ammonium sulphate is suitable as a fertiliser as it is soluble and contains nitrogen <input checked="" type="checkbox"/> D sodium sulphate is not a fertiliser as it has no nitrogen, phosphorus or potassium																																																								
25	A	79	<table border="1"> <thead> <tr> <th>Metal</th> <th>Potassium</th> <th>Sodium</th> <th>Lithium</th> <th>Calcium</th> <th>Magnesium</th> <th>Aluminium</th> <th>Zinc</th> <th>Iron</th> <th>Tin</th> <th>Lead</th> <th>Copper</th> <th>Mercury</th> <th>Silver</th> <th>Gold</th> <th>Platinum</th> </tr> </thead> <tbody> <tr> <td>Reaction With Oxygen</td> <td colspan="8">Burn In Oxygen to Form Metal Oxide</td> <td colspan="2">Slowly React With Oxygen</td> <td colspan="4">No Reaction With Oxygen</td> </tr> <tr> <td>Reaction With Water</td> <td colspan="3">Fast Reaction With Water</td> <td colspan="4">Slow Reaction With Water Faster Reaction With Steam</td> <td colspan="4">No Reaction with Water or Steam</td> </tr> <tr> <td>Reaction With Acids</td> <td colspan="3">Violent Reaction With dilute acids</td> <td colspan="3">React With dilute acids</td> <td colspan="2">Slow Reaction</td> <td colspan="4">No Reaction With dilute acids</td> </tr> </tbody> </table>	Metal	Potassium	Sodium	Lithium	Calcium	Magnesium	Aluminium	Zinc	Iron	Tin	Lead	Copper	Mercury	Silver	Gold	Platinum	Reaction With Oxygen	Burn In Oxygen to Form Metal Oxide								Slowly React With Oxygen		No Reaction With Oxygen				Reaction With Water	Fast Reaction With Water			Slow Reaction With Water Faster Reaction With Steam				No Reaction with Water or Steam				Reaction With Acids	Violent Reaction With dilute acids			React With dilute acids			Slow Reaction		No Reaction With dilute acids

# 2014 Int2 Chemistry Marking Scheme

Long Qu	Answer	Reasoning			
1a	Hydrogen	$\text{ACID} + \text{METAL} \rightarrow \text{SALT} + \text{HYDROGEN}$ $\text{hydrochloric acid} + \text{magnesium} \rightarrow \text{magnesium chloride} + \text{hydrogen}$			
1b(i)	Use syringe to collect gas	All gases can be collected in a gas syringe and their volumes measured against the scale on the gas syringe. Gases which are insoluble can also be collected over water as shown in the diagram.			
1b(ii)	Line graph showing:	$\frac{1}{2}$ mark: labelling axes $\frac{1}{2}$ mark: correct scales $\frac{1}{2}$ mark: plotting points $\frac{1}{2}$ mark: drawing line			
1b(iii)	10	$\text{Rate} = \frac{\Delta \text{quantity}}{\Delta \text{time}} = \frac{86 - 46}{6 - 2} = 10 \text{ cm}^3 \text{ min}^{-1}$			
2a	Repulsion/deflection by (positive) nucleus	Positive (alpha) particles mainly travel straight through the layer of gold. Some of the positive (alpha) particles travel close to the nuclei of the gold atoms. The nuclei of the gold atoms are also positive and deflect the passing positive (alpha) particles by repulsion of positives charges.			
2b(i)	<table border="1" style="margin: auto;"> <tr><td style="text-align: center;">79</td></tr> <tr><td style="text-align: center;">79</td></tr> <tr><td style="text-align: center;">118</td></tr> </table>	79	79	118	Number of protons = atomic number = 79 Number of electrons = atomic number - charge = 79 - 0 = 79 Number of neutrons = mass no - atomic no. = 197 - 79 = 118
79					
79					
118					
2b(ii)	Answer from:	Same atomic number but different mass number number of protons                      number of neutrons			
3a	<u>Oxygen</u> <u>Argon</u> <u>Nitrogen</u>	When the temperature falls below the boiling point of a substance the substance condenses from a gas to a liquid. As temperature decreases, oxygen will be the first gas to condense into a liquid (at $-183^{\circ}\text{C}$ ), then argon condenses (at $-186^{\circ}\text{C}$ ) and finally nitrogen condenses (at $-196^{\circ}\text{C}$ )			
3b	Distillation	Distillation is the process which separates chemicals with different boiling points.			
3c	Air has too low a percentage of oxygen	Oxygen gas will relight a glowing splint because the splint glows so bright that the heat released will reignite the splint.			
4a	Diagram showing:				
4b	Weak	Covalent molecular substances are often gases or liquids at room temperature because there are only weak attractions/bonds between the molecules.			
4c(i)	Partial dissociation into ions	Weak acids and alkali do not fully dissociate into ions.			
4c(ii)	1490	$1 \text{ mol NH}_3 = (1 \times 14) + (3 \times 1) = 14 + 3 = 17 \text{ g}$ $\text{no of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{510}{17} = 30 \text{ mol}$ $3 \text{ NH}_3 + \text{H}_3\text{PO}_4 \longrightarrow (\text{NH}_4)_3\text{PO}_4$ $\begin{array}{ccc} 3 \text{ mol} & & 1 \text{ mol} \\ 30 \text{ mol} & & 10 \text{ mol} \end{array}$ $1 \text{ mol } (\text{NH}_4)_3\text{PO}_4 = (3 \times 14) + (12 \times 1) + (1 \times 31) + (4 \times 16) = 42 + 12 + 31 + 64 = 149 \text{ g}$ $\text{mass} = \text{no. of mol} \times \text{gfm} = 10 \times 149 = 1490 \text{ g}$			

5a	Exothermic	Type	Description	$\Delta H$ sign
		Exothermic	Reaction which gives off heat/energy to surroundings	negative
		Endothermic	Reaction which absorbs heat/energy from the surroundings	positive
5b				
		Monomer	Polymer	Repeating Unit
		5c	Carbon monoxide or hydrogen cyanide	All carbon-based molecules will release poisonous carbon monoxide in a limited supply of air. Molecules that contain the -CN nitrile group will also release poisonous hydrogen cyanide HCN gas on burning.
6a	Less fructose is required for same sweetness	Because fructose is twice as sweet as glucose, half the mass of fructose is required to achieve the same level of sweetness in a food compared to glucose. Because glucose and fructose have very similar energy contents (calories), this halves the calories in foods if fructose is used.		
6b(i)	Isomers	Isomers have the same molecular formula but different structural formulae.		
6b(ii)	Hydroxyl	The -OH group found in alcohols is called the hydroxyl group.		
7a(i)	Heterogeneous	Type of Catalyst	Definition	
		Homogeneous	Catalyst in same state as reactants	
		Heterogeneous	Catalyst in different state from reactants	
7a(ii)	3-methylheptane	Longest chain in structure = 7 carbons $\therefore$ name ends in .....heptane -CH <sub>3</sub> side group in structure $\therefore$ name ends in ... methylheptane Side group on carbon 3 from right $\therefore$ name is 3-methylheptane		
7a(iii)	Any C <sub>8</sub> H <sub>18</sub> structure other than 3-methylheptane.  Structure must have 8 carbons 18 hydrogens 4 bonds per carbon 1 bond per hydrogen	All the isomers of octane are listed below. Be sure not to redraw 3-methylheptane again.		
		octane	2-methylheptane	
		<del>3-methylheptane</del>	4-methylheptane	
		2,2-dimethylhexane	2,3-dimethylhexane	
		2,4-dimethylhexane	2,5-dimethylhexane	
		3,3-dimethylhexane	3,4-dimethylhexane	
		3-ethylhexane	2,3,4-trimethylpentane	
		2,2,3-trimethylpentane	2,2,4-trimethylpentane	
		2,3,3-trimethylpentane	3-ethyl-2-methylpentane	
		3-ethyl-3-methylpentane	2,2,3,3-tetramethylbutane	
7b(i)	Heat catalyst then heat paraffin	The catalyst must be at a high temperature before it will work efficiently. The Bunsen burner initially heats only the catalyst and when it is hot the Bunsen burner is then moved under the paraffin with the heating shared between the paraffin and the catalyst to keep both warm.		
7b(ii)	Bromine decolourises	The alkenes produced during the cracking reaction react with bromine solution and the yellow colour decolourises. The Br <sub>2</sub> molecule adds across the C=C double bonds in the cracking reaction.		
7b(iii)	Remove test tube before heating stops	When the test tube is heated, the air inside expands and bubbles leave the delivery tube. When heating is stopped, the air inside contracts back to its original size but gas cannot re-enter the delivery tube so liquid is sucked up instead. Cold liquid can cause hot glass to crack.		

8a(i)	Ester	Esters are formed by the condensation of alcohols and carboxylic acids. All esters have an ester link: $\begin{array}{c} \text{O} \\    \\ -\text{C}-\text{O}- \end{array}$										
8a(ii)	No C=C double bonds	Saturated hydrocarbons contain C-C single bonds in the carbon chain of the molecule. Unsaturated hydrocarbons contain C=C double bonds (or C≡C triple bonds) which are detected by the decolourisation of bromine solution.										
8b	Glycerol	Glycerol is also known as propane-1,2,3-triol and has the structure: $\begin{array}{ccccc} & \text{H} & \text{H} & \text{H} & \\ &   &   &   & \\ \text{H} & -\text{C} & -\text{C} & -\text{C} & -\text{H} \\ &   &   &   & \\ & \text{OH} & \text{OH} & \text{OH} & \end{array}$										
8c	3.344	$E_h = c \times m \times \Delta T$ Energy = specific heat capacity × mass × change in temperature Energy = 4.18 × 0.1 × 8 Energy = 3.344kJ										
9a	Strong or high strength	<table border="1"> <tbody> <tr> <td>Plastic</td> <td>Kevlar</td> <td>Poly(ethanol)</td> <td>Poly(ethyne)</td> <td>Biopol</td> </tr> <tr> <td>Property</td> <td>Strong</td> <td>Soluble in water</td> <td>Electrical conductor</td> <td>Biodegradable</td> </tr> </tbody> </table>	Plastic	Kevlar	Poly(ethanol)	Poly(ethyne)	Biopol	Property	Strong	Soluble in water	Electrical conductor	Biodegradable
Plastic	Kevlar	Poly(ethanol)	Poly(ethyne)	Biopol								
Property	Strong	Soluble in water	Electrical conductor	Biodegradable								
9b(i)	$\begin{array}{c} \text{O} \quad \text{H} \\    \quad   \\ -\text{C}-\text{N}- \end{array}$	Amide links are found in polyamide polymers while peptide links are found in proteins. Both have the structure: $\begin{array}{c} \text{O} \quad \text{H} \\    \quad   \\ -\text{C}-\text{N}- \end{array}$										
9b(ii)	One from:	$\begin{array}{c} \text{O} \quad \quad \quad \text{O} \\ // \quad \quad \quad // \\ \text{HO}-\text{C}-\text{C}_6\text{H}_4-\text{C}-\text{OH} \\   \quad \quad \quad   \\ \text{OH} \quad \quad \quad \text{OH} \end{array} \quad \text{or} \quad \begin{array}{c} \text{H} \quad \quad \quad \text{H} \\ \diagdown \quad \quad \quad / \\ \text{N}-\text{C}_6\text{H}_4-\text{N} \\ / \quad \quad \quad \diagdown \\ \text{H} \quad \quad \quad \text{H} \end{array}$										
10a	1	$1\text{mol CH}_3\text{COOH} = (2 \times 12) + (4 \times 1) + (2 \times 16) = 24 + 4 + 32 = 60\text{g}$ $\text{no. of mol} = \frac{\text{mass}}{\text{gfm}} = \frac{6}{60} = 0.1 \text{ mol}$ $\text{concentration} = \frac{\text{no. of mol}}{\text{volume}} = \frac{0.1\text{mol}}{0.1\text{litres}} = 1 \text{ mol l}^{-1}$										
10b	<table border="1"> <tbody> <tr> <td>slower</td> </tr> <tr> <td>lower</td> </tr> </tbody> </table>	slower	lower	Magnesium reacts faster with hydrochloric acid than ethanoic acid as hydrochloric acid is a fully dissociated strong acid. Ethanoic acid is a partially dissociated weak acid which contains much less H <sup>+</sup> ions at any one time to react with magnesium. Strong acids are fully ionised and the higher degree of ionisation provides the additional ions to increase the conductivity of the solution.

Filtration	Evaporation											

12a	Nickel is higher up the electrochemical series	Higher up metals in the electrochemical series corrode to protect lower down metals in the electrochemical series. This is sacrificial protection.																																
12b	$\text{Ni} \rightarrow \text{Ni}^{2+} + 2\text{e}^-$	Equation is on page 10 of data booklet but in the reverse direction.																																
12c	Prevents air or water getting to metal	Air/oxygen and water are <u>both</u> required for corrosion to take place. Prevent one or both getting to metal then corrosion is prevented.																																
13a	To complete the circuit	The ions in an electrolyte complete the circuit by moving charge to balance the movement of electrons through the cell.
