

Lesson	National 5 Chemistry		Lesson	Traffic Light				
	JAB chem	Unit 3.1e Electrochemical Cells		JAB chem	Red	Amber	Green	
16	Electrically conducting solutions containing ions are known as electrolytes. <ul style="list-style-type: none"> <li>Movement of ions in the electrolyte completes the circuit</li> </ul>			☹	☹	☺		
17	A simple cell can be made by placing two metals in an electrolyte. <ul style="list-style-type: none"> <li>Electrons move through the voltmeter from the metal higher up the electrochemical series to the metal lower in the series</li> <li>Ions move in the electrolyte to balance up this movement of charge</li> </ul>			☹	☹	☺		
18	Electricity can be produced in a cell by connecting two different metals in solutions of their metal ions. Electrons flow in the external circuit from the metal higher in the electrochemical series to the one lower in the electrochemical series. <ul style="list-style-type: none"> <li>Electrons flow from Magnesium to copper in this circuit</li> </ul>			☹	☹	☺		
19 20 21	Different pairs of metals produce different voltages. These voltages can be used to arrange the elements into an electrochemical series (p10 of data booklet) <ul style="list-style-type: none"> <li>the further apart elements are in the electrochemical series, the greater the voltage produced when they are used to make an electrochemical cell.</li> <li>electrons flow in the external circuit from the species higher in the electrochemical series to the one lower in the electrochemical series.</li> </ul>			☹	☹	☺		
22a 23a	For an electrochemical cell ion-electron equations can be written for: <ul style="list-style-type: none"> <li>the oxidation reaction</li> <li>the reduction reaction</li> <li>the overall redox reactions</li> </ul> The direction of flow of electrons can also be worked out in an electrochemical cell.		<p>At Magnesium Electrode: (oxidation)</p> $\text{Mg(s)} \rightarrow \text{Mg}^{2+}(\text{aq}) + 2\text{e}^{-}$ <p>At Copper Electrode: (reduction)</p> $\text{Cu}^{2+}(\text{aq}) + 2\text{e}^{-} \rightarrow \text{Cu(s)}$ <p>Overall Redox Reaction</p> $\text{Mg(s)} + \text{Cu}^{2+}(\text{aq}) \rightarrow \text{Mg}^{2+}(\text{aq}) + \text{Cu(s)}$	<p>Electrons leave Magnesium (on left) as magnesium atoms form magnesium ions</p> <p>Electrons travel through the wires and Voltmeter</p> <p>Electrons arrive at copper electrode (on right) and join with copper ions to form copper atoms</p> <p>Electrons travel through wires from left to right</p>		☹	☹	☺
22b 23b	Some electrochemical cells involve non-metals as one of their reactions:		<p>At Electrode A:</p> $\text{Ag}^{+}(\text{aq}) + \text{e}^{-} \rightarrow \text{Ag(s)}$ <p>At Electrode B:</p> $2\text{I}^{-}(\text{aq}) \rightarrow \text{I}_2(\text{s}) + 2\text{e}^{-}$ <p>Overall Redox Reaction</p> $\text{Ag}^{+}(\text{aq}) + 2\text{I}^{-}(\text{aq}) \rightarrow \text{Ag(s)} + \text{I}_2(\text{s})$	<p>Electrons leave Electrode B as I<sup>-</sup> ions form I<sub>2</sub> molecules</p> <p>Electrons travel through the wires and Voltmeter</p> <p>Electrons arrive at electrode A and join with Ag<sup>+</sup> ions to form Ag atoms</p> <p>Electrons travel through wires from right to left</p>		☹	☹	☺

2018 MC 19	A	-	<p style="text-align: center;">largest Voltage</p> <p>Order in Electrochemical series      Zinc      Nickel      Tin      Lead</p> <p style="text-align: right; margin-right: 10em;">smallest voltage</p>
2019 MC 18	D	-	<input checked="" type="checkbox"/> A Largest voltage = largest separation on electrochemical series (Magnesium-silver) <input checked="" type="checkbox"/> B 2 <sup>nd</sup> Largest voltage = 2 <sup>nd</sup> largest separation on electrochemical series (zinc-silver) <input checked="" type="checkbox"/> C 3 <sup>rd</sup> Largest voltage = 3 <sup>rd</sup> largest separation on electrochemical series (iron-silver) <input checked="" type="checkbox"/> D Smallest voltage = smallest separation on electrochemical series (copper-silver)

Nat5	Answer	Reasoning			
2016 10a	Electrolyte	An electrolyte is a solution containing ions which helps to complete a circuit by ions moving to balance the movement of charge			
2016 10b(i)	Arrow showing movement from right to left through wires	Zinc is higher up the electrochemical series than copper so electrons move from zinc to copper $\text{Zn}_{(s)} \rightarrow \text{Zn}_{(aq)} + 2e^-$ $\text{Cu}^{2+}_{(aq)} + 2e^- \rightarrow \text{Cu}_{(s)}$			
2016 10b(ii)	ion/salt bridge	Ion bridge is usually filter paper soaked in an ion solution. Ions move through the paper to balance the movement of charge through the wires.			
2017 10a(i)	$3\text{Cu}^{2+} + 2\text{Al}$ $\downarrow$ $3\text{Cu} + 2\text{Al}^{3+}$	$\textcircled{1} \quad \text{Al} \rightarrow \text{Al}^{3+} + 3e^-$ $\textcircled{2} \quad \text{Cu}^{2+} + 2e^- \rightarrow \text{Cu}$ $\textcircled{1} \times 2 \quad 2\text{Al} \rightarrow 2\text{Al}^{3+} + 6e^-$ $\textcircled{2} \times 3 \quad 3\text{Cu}^{2+} + 6e^- \rightarrow 3\text{Cu}$ $\textcircled{1}' + \textcircled{2}' \quad 2\text{Al} + 3\text{Cu}^{2+} \rightarrow 2\text{Al}^{3+} + 3\text{Cu}$			
2018 11a	Arrow showing flow through wires from magnesium/right to copper/left	Electrons travel through wires while ions flow through the solution. Electrons travel from higher metal in electrochemical series ( <i>magnesium on right</i> ) to metal lower down electrochemical series ( <i>copper on left</i> ).			
2018 11b	One answer from:	<table border="1" style="width: 100%; text-align: center;"> <tr> <td style="width: 33%;">Completes the circuit/cell</td> <td style="width: 33%;">allows ions to flow/move/transfer <small>(between the two beakers)</small></td> <td style="width: 33%;">provide ions to complete circuit/cell</td> </tr> </table>	Completes the circuit/cell	allows ions to flow/move/transfer <small>(between the two beakers)</small>	provide ions to complete circuit/cell
Completes the circuit/cell	allows ions to flow/move/transfer <small>(between the two beakers)</small>	provide ions to complete circuit/cell			
2018 11c	$\text{Cu}^{2+} + 2e^- \longrightarrow \text{Cu}$	Reduction is the gain of electrons by the reactant. $\text{Cu}^{2+}$ ions will gain 2 electrons to become Cu metal.			
2019 10a	Ion bridge or salt bridge	The ion bridge is a piece of filter paper soaked in electrolyte. Electrolyte is a salt solution which provides the ions to complete the circuit and allow current to flow through the wires.			
2019 10b(i)	Arrow through wires from right to left	Electrons flow through wires and ions flow through the solution. Electrons are generated in the reaction in beaker B: $2\text{I}^-_{(aq)} \longrightarrow \text{I}_{2(l)} + 2e^-$ Electrons flow through voltmeter to Beaker A and join up by the $\text{Fe}^{3+}$ ions $\text{Fe}^{3+}_{(aq)} + e^- \longrightarrow \text{Fe}^{2+}_{(aq)}$

Int2	Answer	Reasoning																																
2001 14b	Completes the circuit	Electrolytes complete the circuit by balancing the movement of charged electrons by allowing ions to move too.																																
2002 6c	Voltage above 0.5V e.g. 0.7V	The further apart metals are from each other on the electrochemical series, the higher the voltage of the cell. A zinc is further from copper than iron is from copper, the zinc-copper cell will have a high voltage than an iron-copper cell																																
2003 3a	← From right (B) to left (A)	Electrons are released by the reaction at electrode B (right) Electrons move from electrode B to electrode A Electrons are picked up by the reaction at electrode A (left)																																
2003 3c	To complete circuit	The ion bridge completes the circuit as it allows ions to travel from side to side to balance the movement of charge moving within the circuit.																																
2007 13b	The higher metal is in electrochemical series the higher the voltage	The voltage from a cell is directly linked to the position of the two metals in the electrochemical series. The bigger the difference the higher the voltage.																																
2008 14a	To complete the circuit	Ions are able to move to complete the circuit																																
2010 14b(i)	← From right to left	<table border="1"> <tr> <td>Electrons are generated on iron electrode (right):</td> <td><math>\text{Fe} \rightarrow \text{Fe}^{2+} + 2\text{e}^-</math></td> </tr> <tr> <td>Electrons are accepted by iodine at carbon electrode (left):</td> <td><math>\text{I}_2 + 2\text{e}^- \rightarrow 2\text{I}^-</math></td> </tr> </table>	Electrons are generated on iron electrode (right):	$\text{Fe} \rightarrow \text{Fe}^{2+} + 2\text{e}^-$	Electrons are accepted by iodine at carbon electrode (left):	$\text{I}_2 + 2\text{e}^- \rightarrow 2\text{I}^-$																												
Electrons are generated on iron electrode (right):	$\text{Fe} \rightarrow \text{Fe}^{2+} + 2\text{e}^-$																																	
Electrons are accepted by iodine at carbon electrode (left):	$\text{I}_2 + 2\text{e}^- \rightarrow 2\text{I}^-$																																	
2011 14a	3	Metal 3 is above copper in electrochemical series as electrons flow to copper Metal 3 gives biggest voltage so is furthest from copper in electrochemical series																																
2011 14b	2 + 3	Metals furthest apart in electrochemical series give biggest voltage <ul style="list-style-type: none"> <li>• Metal 3 is the highest metal in electrochemical series (see above)</li> <li>• Metal 2 is the lowest metal in the electrochemical series <ul style="list-style-type: none"> <li>○ Metal 2 is below copper in electrochemical series as electrons flow from copper</li> <li>○ Metal 2 gives bigger voltage of metals below copper in ECS</li> </ul> </li> </ul>																																
2011 14c	0 or zero	Same metal attached to each other gives zero voltage in a cell																																
2011 14d	Glucose is covalent and has no ions	A solution containing ions is required for the electrolyte. Glucose ( $\text{C}_6\text{H}_{12}\text{O}_6$ ) is covalent as it only contains non-metal atoms and therefore does not complete the circuit as it contains no ions.																																
2014 13a	To complete the circuit	The ions in an electrolyte complete the circuit by moving charge to balance the movement of electrons through the cell.																																
2014 13b(i)	10.92	<table border="1"> <tr> <td>Number of Pairs of Discs</td> <td>1</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> <td>7</td> </tr> <tr> <td>Voltage (V)</td> <td>1.56</td> <td>3.12</td> <td>4.68</td> <td>6.24</td> <td>7.80</td> <td>9.36</td> <td>-</td> </tr> <tr> <td>Difference</td> <td></td> <td>1.56</td> <td>1.56</td> <td>1.56</td> <td>1.56</td> <td>1.56</td> <td>(1.56)</td> </tr> <tr> <td>Prediction (V)</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> <td>-</td> <td>10.92</td> </tr> </table>	Number of Pairs of Discs	1	2	3	4	5	6	7	Voltage (V)	1.56	3.12	4.68	6.24	7.80	9.36	-	Difference		1.56	1.56	1.56	1.56	1.56	(1.56)	Prediction (V)	-	-	-	-	-	-	10.92
Number of Pairs of Discs	1	2	3	4	5	6	7																											
Voltage (V)	1.56	3.12	4.68	6.24	7.80	9.36	-																											
Difference		1.56	1.56	1.56	1.56	1.56	(1.56)																											
Prediction (V)	-	-	-	-	-	-	10.92																											
2014 13b(ii)	Decrease in voltage	Copper and silver are closer together on the electrochemical series																																

2015 11b(i)	Any answer from:	The greater the difference in reactivity (between the metals) the greater the voltage	The more reactive, the less the voltage
		Metals close to Mg on the Electrochemical Series will produce lower voltage	The less reactive the metal, the greater the voltage
2015 11b(ii)	Value greater than 2.25	Magnesium and Lead produce a voltage of 2.25V. Magnesium and Copper will produce a bigger voltage because Copper is lower on the electrochemical series than Lead. There is a greater voltage in a Magnesium/Copper cell than Magnesium/Lead cell.	
2015 11c	Complete the circuit or allow ions to move	The ionic solution of sodium chloride provide the ions needed to complete the circuit. Ions move to balance the charge in the cell caused by the movement of electrons through the wires from the magnesium electrode to the lead electrode.	
2015 16b	left to right (through wires)	Electrons formed in Beaker A (left)	$4\text{OH}^- \longrightarrow 2\text{H}_2\text{O} + \text{O}_2 + 4\text{e}^-$
		Electrons travel to Beaker B (right) to be gained by $\text{Fe}^{3+}$	$\text{Fe}^{3+} + \text{e}^- \longrightarrow \text{Fe}^{2+}$

SG Credit	Answer	Reasoning
2000C 14a	to complete the circuit	ions move from one beaker to the other beaker to balance movement of electrons through the wires.
2000C 14c	Any metal below tin in electrochemical series	The further apart the metals on the electrochemical series, the greater the voltage produced
2001C 15a	Arrow from B (RIGHT) to A (LEFT) through wires	Electrons travel through wires (not solution) From Question: Reaction in beaker B produces electrons
2001C 15b(i)	Oxidation	Oxidation is loss of electrons (electrons right of arrow)
2001C 15b(ii)	pH decreases	H <sup>+</sup> ions (acid) produced as reaction proceeds
2001C 15c	Br <sub>2</sub> + 2e <sup>-</sup> → 2Br <sup>-</sup>	Equation on page 10 of data booklet
2002C 13c(i)	copper                      silver silver nitrate solution	In cells, a metal electrode is placed in a solution of its own ions e.g. silver in silver nitrate solution
2002C 13c(ii)	precipitate produced in ion bridge	sodium carbonate will react with copper nitrate to form copper carbonate precipitate. Sodium carbonate will react with silver nitrate to form silver carbonate precipitate. Precipitate may stop ion bridge from completing the circuit.
2003C 16a(i)	From B(RIGHT) to A(LEFT) through the wires	At Electrode A: Fe <sup>3+</sup> (aq) + e <sup>-</sup> → Fe <sup>2+</sup> (aq) Electrons are moving from B to A for Fe <sup>3+</sup> ion to gain electrons

2003C 16a(ii)	Reduction	Reduction is Gain of Electrons: $\text{Fe}^{3+} + \text{e}^- \longrightarrow \text{Fe}^{2+}$
2003C 19a(i)	1 <sup>st</sup> clip on zinc rod 2 <sup>nd</sup> clip on copper can	cells which produce electricity often have two different metals in them.
2003C 19a(ii)	ions cannot move through glass	ions need to move through porous cardboard container to complete circuit (glass blocks movement of ions)
2003C 19a(iii)	reading decreases	tin is closer to copper in the electrochemical series so voltage/current will be lower.
2005C 19a	Arrow showing movement of electron through wires from A(left) to B(right)	Reaction at Electrode A produces electrons Reaction at electrode B accepts electrons $\therefore$ electrons travel from A to B through wires
2005C 19b	To complete the circuit	Ions in electrolyte are able to flow and complete the circuit between the electrodes
2006C 10a	Arrow pointing from Left (X) to Right (Y)	In question $\text{Fe}^{3+}$ ions (at electrode Y) are accepting electrons so electrons must be moving from Left (X) to Right (Y)
2007C 19c(ii)	to complete circuit	The ions in the electrolyte move between electrodes to complete the circuit
2009C 17b	( $\longleftarrow$ ) From Right to Left or from Y to X	The reaction at electrode Y produces electrons: $2\text{I}^- \rightarrow \text{I}_2 + 2\text{e}^-$ Electrons travel from electrode Y to electrode X The reaction at electrode X uses up these electrons: $\text{Br}_2 + 2\text{e}^- \rightarrow 2\text{Br}^-$
2010C 17d	iron                      silver  silver nitrate	As Iron is higher up electrochemical series than silver (p10 data booklet) <ul style="list-style-type: none"> <li>Iron electrode must be on left as electrons flow from left to right</li> <li>Silver electrode must be on right as electrons flow from left to right</li> </ul> Silver nitrate solution is used with silver electrode 1 <sup>st</sup> line of question states silver nitrate is used
2011C 21a	from B to A through the wires	<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p><u>Electrode A</u></p> <math>2\text{Au}^+ + 2\text{e}^- \longrightarrow 2\text{Au}</math> <p>Electrons are absorbed by <math>\text{Au}^+</math> ions in the above reduction reaction</p> </div> <div style="text-align: center;"> <p>Electrons flow from B to A</p> </div> <div style="text-align: center;"> <p><u>Electrode B</u></p> <math>2\text{Br}^- \longrightarrow \text{Br}_2 + 2\text{e}^-</math> <p>Electrons are generated in the above oxidation reaction</p> </div> </div>
2011C 21c	Ion bridge	Ion bridge completes the circuit by balancing the movement of charge through the wires e.g. ions bridge can be filter paper soaked in ionic solution
2012C 19b	From A to B through the wires	At Electrode A: $\text{Zn} \rightarrow \text{Zn}^{2+} + 2\text{e}^-$ . Electrons leave electrode A and travel to electrode B. Electrons travel through the wires (Ions travel through the solution)
2013C 14c(i)	zinc                      copper  zinc sulphate solution	The metals in a cell should be placed in solutions of that metal <ul style="list-style-type: none"> <li>Copper electrode is placed in copper sulphate solution</li> <li>Zinc electrode is placed in a zinc sulphate solution (any soluble zinc compound can be used as the electrolyte in the zinc electrode beaker)</li> </ul>
2013C 14c(ii)	To complete the circuit	The ion bridge contains an ionic solution which allows ions to move through the ion bridge to balance the movement of charge from zinc to copper

# Past Paper Question Bank

## Unit 3.1e Electrochemical Cells

Outcome	<a href="#">2000</a> <i>General</i>	<a href="#">2001</a> <i>General</i>	<a href="#">2002</a> <i>General</i>	<a href="#">2003</a> <i>General</i>	<a href="#">2004</a> <i>General</i>	<a href="#">2005</a> <i>General</i>	<a href="#">2006</a> <i>General</i>	<a href="#">2007</a> <i>General</i>	<a href="#">2008</a> <i>General</i>	<a href="#">2009</a> <i>General</i>	<a href="#">2010</a> <i>General</i>	<a href="#">2011</a> <i>General</i>	<a href="#">2012</a> <i>General</i>	<a href="#">2013</a> <i>General</i>

SG General	Answer	Reasoning
2001G 15a(i)	chemical reaction	A chemical reaction inside a battery produces the electricity
2001G 15b(i)	From left to right → (iron to copper)	Iron is higher up the electrochemical series than copper (p7 data booklet) Electrons always flow from the higher up metal to the lower down metal.
2001G 15b(ii)	higher voltage	The bigger the gap in the electrochemical series, the higher the voltage. • Aluminium is higher up electrochemical series than iron Al/Cu cell has a bigger voltage than an Fe/Cu cell
2002G 11a(i)	chemicals run out	Cells/batteries are portable but run out when the chemicals in the battery are used up
2002G 11a(iii)	ions cannot move when dry	Ions cannot move in the solid state but can move when in solution or molten
2003G 17a	electrons	Electrons are charged particles which travel through the wires Ions are charged particles which travel through the solution.
2003G 17b	to complete the circuit	The electrolyte completes the circuit as the ions move through the filter paper to balance the movement of charge as electrons move through the wires.
2003G 17d	magnesium or aluminium	Magnesium or aluminium are higher up the electrochemical series and would produce a higher voltage than zinc in a cell with copper. Potassium, sodium, lithium and calcium are also higher up but would not work in practice as they would react with the water in the solution.
2004G 15a	to complete the circuit	The salt solution electrolyte completes the circuit as the ions move through the filter paper to balance the movement of electrons through the wires.
2004G 15b	nickel ↓ Copper (through wires & ammeter)	Nickel is higher up the electrochemical series than copper. Electrons always flow from the higher up metal to the lower metal
2004G 15c	any metal below copper	Any metal below copper in the electrochemical series will result in a change of direction of electron flow: mercury    silver    gold    platinum
2005G 12a(i)	electrons	electrons travel through wires, ions travel through solutions.
2005G 12a(ii)	voltage below 0.92V	tin/copper are closer together than zinc/copper on electrochemical series. Smaller gap on electrochemical series means smaller voltage
2006G 19a	to complete circuit	electrolyte must be an ionic/salt solution
2006G 19b	silver    then    gold	silver is higher up electrochemical series than gold so electrons flow from the higher metal (silver) to the lower metal (gold)
2007G 15b(i)	right to left ← (Zinc to Nickel)	Electrons flow through the wires from the higher up metal to the lower down metal in the electrochemical series (p10 of data booklet)

2007G 15b(ii)	higher voltage	Replacing nickel with copper makes the difference between zinc and copper greater on the electrochemical series (p10 of data booklet)									
2009G 15b(i)	Value between 0.5V - 2.7V	Magnesium is higher up electrochemical series than iron ∴ voltage will be less than 2.7V Tin is lower down electrochemical series than iron ∴ voltage will be more than 0.5V									
2010G 19a	From right to left ← (iron to copper)	Iron is higher up the electrochemical series than copper (p10 data booklet) Electrons always flow from the higher up metal to the lower down metal.									
2010G 19c	Nickel, Tin or Lead	The electrochemical series is found on p10 of the data booklet Magnesium Aluminium Zinc Iron ← Nickel ← Tin ← Lead ← Copper Replacing iron with one of these metals will decrease the voltage									
2010G 19d	To complete the circuit	The ion bridge is a piece of filter soaked in an electrolyte e.g. salt solution. The ion bridge completes the circuit by allow charged ions to travel from side to side to balance out the movement of negative charge in the electrical current.									
2011G 21a(i)	electrolyte	Electrolytes are ionic compounds which complete a circuit as they allow ions to move between electrodes to balance the movement of charge.									
2011G 21a(ii)	<table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>zinc</td><td>copper</td><td>wires</td></tr></table>	zinc	copper	wires	Electrons always flow from metals higher in the electrochemical series to metals lower in the electrochemical series ∴ zinc to copper Electrons flow through the wires, ions flow through the solution/paste.						
zinc	copper	wires									
2012G 16a	Electrons	Electrons flow through wires, ions move through solutions.									
2012G 16b	Any metal lower than zinc in ECS	Any one from: <table border="1" style="display: inline-table; vertical-align: middle;"><tr><td>iron</td><td>nickel</td><td>tin</td><td>lead</td></tr><tr><td>copper</td><td>mercury</td><td>silver</td><td>gold</td><td>platinum</td></tr></table>	iron	nickel	tin	lead	copper	mercury	silver	gold	platinum
iron	nickel	tin	lead								
copper	mercury	silver	gold	platinum							
2013G 18a(i)	Arrow on wires L → R	Electrons always travel through wires, not through the electrolyte solution. Electrons will travel from the metal higher up the electrochemical series (iron) to the metal lower down the electrochemical series (copper)									
2013G 18a(ii)	Increase in voltage	iron/copper cell gives a voltage related to the positions on ECS Aluminium    Zinc    Iron    Nickel    Tin    Lead    Copper aluminium/copper cell gives a bigger voltage as there is a bigger separation on ECS
