

Lesson	Traffic Light																																																													
	Red	Amber	Green																																																											
40	Radioactive decay involves changes in the nuclei of atoms. Unstable nuclei (radioisotopes) can become more stable nuclei by giving out alpha, beta or gamma radiation.			☹	☹	☺																																																								
41 44a 46a	Alpha particles (α) are helium nuclei <ul style="list-style-type: none"> alpha particles have a mass number = 4 and an atomic number = 2 alpha particles have a double positive charge as they have no electrons deflected by an electric field towards the negatively charged plate stopped by piece of paper and travel only a few centimetres ${}^4_2\text{He}$ <p>Alpha decay of ${}^{210}_{84}\text{Po}$ can be written as:</p> ${}^{210}_{84}\text{Po} \rightarrow {}^{206}_{82}\text{Pb} + {}^4_2\text{He}$			☹	☹	☺																																																								
42 44b 46b	Beta particles (β) are electrons ejected from a nucleus <ul style="list-style-type: none"> beta particles have a mass number = 0 and an atomic number = -1 beta particles have a negative charge deflected by an electric field towards a positively charge plate stopped by thin sheet of aluminium and travel over a metre in air ${}^0_{-1}\text{e}$ <p>Beta decay of ${}^{99}_{42}\text{Mo}$ can be written as:</p> ${}^{99}_{42}\text{Mo} \rightarrow {}^{99}_{43}\text{Tc} + {}^0_{-1}\text{e}$			☹	☹	☺																																																								
43	Gamma rays (γ) are electromagnetic waves emitted from within the nucleus of an atom. <ul style="list-style-type: none"> Gamma radiation is able to travel great distances in air. They can be stopped by barriers made of materials such as lead or concrete. Gamma rays are not deflected by an electric field. 			☹	☹	☺																																																								
45	In nuclear equations alpha, beta, protons and neutrons are written as: <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Alpha particle</th> <th>Beta Particle</th> <th>Proton</th> <th>Neutron</th> </tr> </thead> <tbody> <tr> <td>${}^4_2\text{He}$</td> <td>${}^0_{-1}\text{e}$</td> <td>${}^1_1\text{p}$</td> <td>${}^1_0\text{n}$</td> </tr> </tbody> </table>			Alpha particle	Beta Particle	Proton	Neutron	${}^4_2\text{He}$	${}^0_{-1}\text{e}$	${}^1_1\text{p}$	${}^1_0\text{n}$	☹	☹	☺																																																
Alpha particle	Beta Particle	Proton	Neutron																																																											
${}^4_2\text{He}$	${}^0_{-1}\text{e}$	${}^1_1\text{p}$	${}^1_0\text{n}$																																																											
47	Half-life is the time for half of the nuclei of a particular isotope to decay.			☹	☹	☺																																																								
48	The half-life of an isotope is a constant. Half-life is unaffected by temperature, chemical conditions (compound form or element) or physical conditions (solid, liquid, gas or solution). Radioactive isotopes can be used to date materials e.g. carbon dating of ${}^{14}\text{C}$.			☹	☹	☺																																																								
49	The half-life of an isotope can be determined from a graph showing a decay curve. <ul style="list-style-type: none"> Find a halving of the quantity on the y-axis e.g. 100% to 50% or 2g to 1g Measure the time taken for the halving to take place on the x-axis 			☹	☹	☺																																																								
50	The quantity/proportion of radioisotope, half-life or time elapsed from the other variables: <table border="1" style="width: 100%;"> <tr> <td style="width: 33%;"> Calculate the half-life of the radioisotope if it takes 45 days for 2g of radioisotope to decay into 0.1g of the radioisotope. <table border="1" style="width: 100%;"> <thead> <tr> <th>Mass (g)</th> <th>No of Half Lives</th> </tr> </thead> <tbody> <tr><td>3.2</td><td>0</td></tr> <tr><td>1.6</td><td>1</td></tr> <tr><td>0.8</td><td>2</td></tr> <tr><td>0.4</td><td>3</td></tr> <tr><td>0.2</td><td>4</td></tr> <tr><td>0.1</td><td>5</td></tr> </tbody> </table> 5 x $t_{1/2}$ = 45 days $\therefore t_{1/2}$ = 9days </td> <td style="width: 33%;"> How long did it take for 80g of a radioisotope with a half-life of 17 days 0.625g of radioisotope? <table border="1" style="width: 100%;"> <thead> <tr> <th>Mass (g)</th> <th>Time Taken (days)</th> </tr> </thead> <tbody> <tr><td>80</td><td>0</td></tr> <tr><td>40</td><td>17</td></tr> <tr><td>20</td><td>34</td></tr> <tr><td>10</td><td>51</td></tr> <tr><td>5</td><td>68</td></tr> <tr><td>2.5</td><td>85</td></tr> <tr><td>1.25</td><td>102</td></tr> <tr><td>0.625</td><td>119 days</td></tr> </tbody> </table> </td> <td style="width: 33%;"> A radioisotope has a half-life of 3hours. H	Answer	% Correct	Reasoning										
2000 Higher MC 29	C	69	On β -emission, the mass number stays the same and the atomic number increases by one. This would turn a group 4 element into a group 5 element										
2000 Higher MC 30	C	83	<table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td>Time (years)</td> <td>0</td> <td>21</td> <td>42</td> <td>63</td> </tr> <tr> <td>Fraction</td> <td>1</td> <td>$\frac{1}{2} = 0.5$</td> <td>$\frac{1}{4} = 0.25$</td> <td>$\frac{1}{8} = 0.125$</td> </tr> </table>	Time (years)	0	21	42	63	Fraction	1	$\frac{1}{2} = 0.5$	$\frac{1}{4} = 0.25$	$\frac{1}{8} = 0.125$
Time (years)	0	21	42	63									
Fraction	1	$\frac{1}{2} = 0.5$	$\frac{1}{4} = 0.25$	$\frac{1}{8} = 0.125$									
2001 Higher MC 30	C	37	Half life is the same as the nucleus splitting is the same with the same half-life. The intensity of the radiation is different as 1g of radium metal contains more radium nuclei than 1g of radium oxide										
2002 Higher MC 29	D	46	Strontium has atomic number of 38 (date booklet) \rightarrow 38 protons. Number of neutrons = mass number - atomic number = 90 - 38 = 52 neutrons \therefore ratio of neutrons:protons = 52:38 = 1.37:1										
2003 Higher MC 38	C	58	<input checked="" type="checkbox"/> A Half-life must be the same for the same isotope of lead <input checked="" type="checkbox"/> B Half-life must be the same for the same isotope of lead <input checked="" type="checkbox"/> C Same lead isotope means same half life & different intensity due to concentration <input checked="" type="checkbox"/> D Intensity of radiation will be different as there is less radioactive lead in the solution										
2003 Higher MC 39	A	69	β -emission: neutron splits into proton (stays in nucleus) and electron (ejected from nucleus) β -emission: atomic number increases +1 and Mass number stays same										
2005 Higher MC 39	B	70	Neutron capture involves changing the number of neutrons so there is no change of atomic number (ie number of protons). Answer B is the only answer with the same atomic number as ^{32}P .										
2005 Higher MC 40	B	57	α -emission \rightarrow loss of mass of 4 \therefore mass no.=200 is starting isotope. 25% of starting isotope (200) remains so 2 half-lives have passed 2 half-lives = 8 days \therefore 1 half-life = 4 days										
2006 Higher MC 39	C	66	25% of ^{14}C left \rightarrow 2 half-lives have passed. 1 half-life = 5600 years \therefore 2 half-lives = 2x5600 = 11200 years										
2006 Higher MC 40	B	70	β -emission: atomic number increases by 1 & mass number remains constant \therefore mass number remains at 231 during β -emission										
2007 Higher MC 39	C	57	Number of protons = atomic number = 38 Number of neutrons = mass number - atomic number = 90 - 38 = 52 <div style="text-align: center;"> Neutron : Proton 52 : 38 1.37 : 1 </div>										

2007 Higher MC 40	D	72	Alpha Particles are positive ∴ attracted towards negative plate (Path X) Beta Particles are negative ∴ attracted towards positive plate (Path Z) Gamma Rays have no charge ∴ travel straight through (Path Y)												
2008 Higher MC 39	C	92	${}_{90}^{227}\text{Th} \rightarrow {}_{88}^{223}\text{Ra} \rightarrow {}_{86}^{219}\text{Rn} \rightarrow {}_{84}^{215}\text{Po} \rightarrow {}_{82}^{211}\text{Pb}$ ∴ 4 alpha particles removed
