2022 National 5 Chemistry Marking Scheme

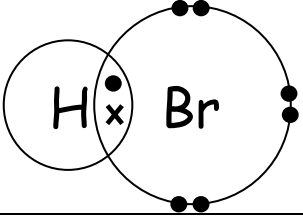

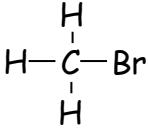

MC Qu	Answer	% Pupils Correct	Reasoning
1	C	91	<input checked="" type="checkbox"/> A Hydrogen H has an atomic number of 1. Hydrogen is a non-metal. <input checked="" type="checkbox"/> B Arsenic As has an atomic number of 33. Arsenic is a non-metal. <input checked="" type="checkbox"/> C Rhodium Rh has an atomic number of 45. Rhodium is a metal. <input checked="" type="checkbox"/> D Radon Rn has an atomic number of 86. Radon is a non-metal.
2	B	83	<input checked="" type="checkbox"/> A Protons are positive and neutrons are neutral \therefore overall this would be positive. <input checked="" type="checkbox"/> B Atoms are neutron because no. of protons <u>equals</u> no of electrons <input checked="" type="checkbox"/> C number of protons plus neutrons is greater than number of electrons <input checked="" type="checkbox"/> D number of electrons plus protons is greater than number of neutrons
3	A	46	<input checked="" type="checkbox"/> A weak forces of attraction are found between molecules not inside molecules <input checked="" type="checkbox"/> B strong forces of attraction are found inside molecules not between molecules <input checked="" type="checkbox"/> C weak forces of attraction are found between molecules not inside molecules <input checked="" type="checkbox"/> D strong forces of attraction are found inside molecules not between molecules
4	C	52	<input checked="" type="checkbox"/> A Adding more solvent would dilute the solution and decrease the concentration <input checked="" type="checkbox"/> B Adding more solute would increase the concentration of the solute dissolved <input checked="" type="checkbox"/> C Adding solute increases concentration. Adding solvent decreases concentration <input checked="" type="checkbox"/> D Adding more solvent would dilute the solution and decrease the concentration
5	B	91	<input checked="" type="checkbox"/> A The shape is similar to the shape of CH_4 and is called tetrahedral <input checked="" type="checkbox"/> B The shape is similar to the shape of H_2O and is called angular <input checked="" type="checkbox"/> C The shape is similar to the shape of HCl and is called linear <input checked="" type="checkbox"/> D The shape is similar to the shape of NH_3 and is called trigonal pyramidal
6	A	91	<input checked="" type="checkbox"/> A Electronegativity of O=3.4 & Electronegativity of H=2.2 \therefore Electronegativity Difference = 1.2 <input checked="" type="checkbox"/> B Electronegativity of N=3.0 & Electronegativity of H=2.2 \therefore Electronegativity Difference = 0.8 <input checked="" type="checkbox"/> C Electronegativity of C=2.6 & Electronegativity of H=2.2 \therefore Electronegativity Difference = 0.4 <input checked="" type="checkbox"/> D Electronegativity of C=2.6 & Electronegativity of O=3.4 \therefore Electronegativity Difference = 0.8
7	A	54	<input checked="" type="checkbox"/> A Copper forms at negative electrode and chlorine gas forms at positive electrode <input checked="" type="checkbox"/> B Copper forms at negative electrode as positive Cu^{2+} ions move to negative electrode <input checked="" type="checkbox"/> C Chlorine gas forms at positive electrode as negative Cl^- ions move to positive electrode <input checked="" type="checkbox"/> D Chlorine gas forms at positive electrode as negative Cl^- ions move to positive electrode
8	D	35	<input checked="" type="checkbox"/> A Calcium oxide cannot be formed by the neutralisation of an acid <input checked="" type="checkbox"/> B Hydrogen nitrate cannot be formed by the neutralisation of an acid <input checked="" type="checkbox"/> C Sodium hydroxide cannot be formed by the neutralisation of an acid. <input checked="" type="checkbox"/> D Potassium ethanoate is a salt formed by the neutralisation of ethanoic acid by a base like sodium hydroxide
9	D	54	<input checked="" type="checkbox"/> A pH=3 is acidic and ammonia dissolves in water to form an alkali with pH>7 <input checked="" type="checkbox"/> B pH=5 is acidic and ammonia dissolves in water to form an alkali with pH>7 <input checked="" type="checkbox"/> C pH=7 is acidic and ammonia dissolves in water to form an alkali with pH>7 <input checked="" type="checkbox"/> D pH=9 is alkaline and ammonia dissolves in water to form an alkali with pH>7
10	C	48	<input checked="" type="checkbox"/> A Methane CH_4 burns to form CO_2 and H_2O . The CO_2 would turn limewater milky. <input checked="" type="checkbox"/> B Carbon Monoxide CO burns to form CO_2 . The CO_2 would turn limewater milky. <input checked="" type="checkbox"/> C Hydrogen H_2 burn to form H_2O only. H_2O would condense as a colourless liquid. <input checked="" type="checkbox"/> D Ethane C_2H_6 burns to form CO_2 and H_2O . The CO_2 would turn limewater milky.
11	C	73	<input checked="" type="checkbox"/> A C_4H_{10} molecule is butane and has a boiling point of -1°C <input checked="" type="checkbox"/> B C_4H_8 molecule is but-1-ene and has a boiling point of -6°C <input checked="" type="checkbox"/> C $\text{C}_3\text{H}_7\text{COOH}$ molecule is butanoic acid and has a boiling point of 164°C <input checked="" type="checkbox"/> D $\text{C}_4\text{H}_9\text{OH}$ molecule is butan-2-ol and has a boiling point of 100°C
12	D	52	<input checked="" type="checkbox"/> A molecule has no $\text{C}=\text{C}$ double bond and would not decolourise bromine solution <input checked="" type="checkbox"/> B molecule has no $\text{C}=\text{C}$ double bond and would not decolourise bromine solution <input checked="" type="checkbox"/> C molecule has no COOH Carboxyl group and would not produce an acidic pH <input checked="" type="checkbox"/> D Carboxyl $-\text{COOH}$ group has acid pH & $\text{C}=\text{C}$ double bond decolourises bromine solution

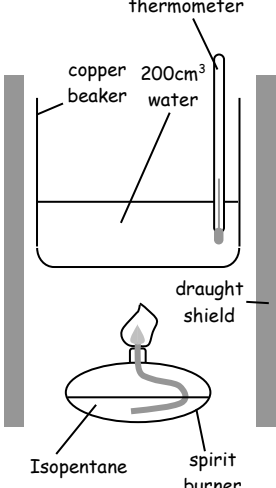

13	B	79	Structure									
			Formula	C_3H_6O	C_4H_8O	$C_5H_{10}O$						
			Relationship	If $n=3$ then $2n=6$	If $n=4$ then $2n=8$	If $n=5$ then $2n=10$						
			General Formula	$C_nH_{2n}O$	$C_nH_{2n}O$	$C_nH_{2n}O$						
14	B	59	Cycloalkanes have a general formula of C_nH_{2n} .									
			no of Carbons C_n	C_3	C_4	C_5						
			Formula C_nH_{2n}	C_3H_6	C_4H_8	C_5H_{10}						
		gfm	$(3 \times 12) + (6 \times 1) = 42$	$(4 \times 12) + (8 \times 1) = 56$	$(5 \times 12) + (10 \times 1) = 70$							
15	A	84	<input checked="" type="checkbox"/> A metallic bonding: attraction between positive ions and delocalised electrons <input checked="" type="checkbox"/> B the positive ion in metallic bonding is formed by the nucleus and the inner shells <input checked="" type="checkbox"/> C ionic bonding: attraction between positive ions and negative ions <input checked="" type="checkbox"/> D covalent bonding: attraction between a shared pair of electrons and two nuclei									
			16	B	86	<input checked="" type="checkbox"/> A melting point of $98^\circ C$ is below the required $600^\circ C$ <input checked="" type="checkbox"/> B Melting point above $600^\circ C$ and density below $3g\ cm^{-3}$ <input checked="" type="checkbox"/> C density of $6.52\ g\ cm^{-3}$ is above the required density of $3g\ cm^{-3}$ <input checked="" type="checkbox"/> D density of $8.96\ g\ cm^{-3}$ is above the required density of $3g\ cm^{-3}$						
						17	A	58	<input checked="" type="checkbox"/> A aluminium is extracted from ore by electrolysis and Al_2O_3 is insoluble in water <input checked="" type="checkbox"/> B calcium oxide is soluble in water and forms an alkali in water <input checked="" type="checkbox"/> C copper metal is extracted by heating copper ore with carbon/carbon monoxide <input checked="" type="checkbox"/> D lead metal is extracted by heating lead ore with carbon/carbon monoxide			
									18	D	73	<input checked="" type="checkbox"/> A electrons travel through connecting wires not the electrolyte solution <input checked="" type="checkbox"/> B electrons travel through connecting wires not the electrolyte solution <input checked="" type="checkbox"/> C electrons travel from aluminium to nickel as aluminium is higher than nickel in ECS <input checked="" type="checkbox"/> D electrons travel from aluminium to nickel through the connecting wires as aluminium is higher than nickel in ECS
19	B	77	Electrochemical Series	Magnesium	Zinc (D)	Iron (A)	Tin (C)	Lead (B)				
			Voltage									
20	C	81	$1 \quad Br_2(l) \quad \quad \quad + \quad 2e^- \quad \rightarrow \quad 2Br^-(aq)$ $2 \quad \quad \quad SO_3^{2-}(aq) + H_2O(l) \quad \rightarrow \quad \quad \quad SO_4^{2-}(aq) + 2H^+(aq) + 2e^-$ Add $1+2 \quad Br_2(l) + SO_3^{2-}(aq) + H_2O(l) + 2e^- \rightarrow 2Br^-(aq) + SO_4^{2-}(aq) + 2H^+(aq) + 2e^-$ cancel down $Br_2(l) + SO_3^{2-}(aq) + H_2O(l) + \cancel{2e^-} \rightarrow 2Br^-(aq) + SO_4^{2-}(aq) + 2H^+(aq) + \cancel{2e^-}$ redox $Br_2(l) + SO_3^{2-}(aq) + H_2O(l) \rightarrow 2Br^-(aq) + SO_4^{2-}(aq) + 2H^+(aq)$									
			21	A	82	Monomer	Repeating Unit	Polymer				
22	B	62	<input checked="" type="checkbox"/> A iron is the catalyst in the Haber Process not the Ostwald Process <input checked="" type="checkbox"/> B platinum is the catalyst in the Ostwald process which produces nitric acid HNO_3 <input checked="" type="checkbox"/> C iron is the catalyst in the Haber Process not the Ostwald Process <input checked="" type="checkbox"/> D ammonia NH_3 is the product of the Haber Process not the Ostwald Process									

23	C	67	<input checked="" type="checkbox"/> A All ^{222}Rn atoms have the same half-life due to having the same proton : neutron ratio <input checked="" type="checkbox"/> B All ^{222}Rn atoms have the same half-life due to having the same proton : neutron ratio <input checked="" type="checkbox"/> C ^{222}Rn has a p:n ratio of 136:86 and the half-life is the same for all atoms of ^{222}Rn <input checked="" type="checkbox"/> D The intensity of the radiation would change by having different size plants but the time taken for the radiation to halve (half-life) would remain the same.
24	D	55	<input checked="" type="checkbox"/> A alpha particles are stopped by paper \therefore would not be able to escape through skin <input checked="" type="checkbox"/> B long half-life would result in radiation escaping for potentially years to come. <input checked="" type="checkbox"/> C alpha particles are stopped by paper \therefore would not be able to escape through skin <input checked="" type="checkbox"/> D an isotope with beta particles released which are able to escape the skin and a short half-life is the best combination for this treatment.
25	C	80	<input checked="" type="checkbox"/> A Beaker is an inaccurate method to measure volume. <input checked="" type="checkbox"/> B Measuring cylinder is not as accurate as a 25cm^3 pipette for measuring volume <input checked="" type="checkbox"/> C Most accurate method for measuring 25cm^3 is to use a 25cm^3 pipette. <input checked="" type="checkbox"/> D Conical flask is an inaccurate method of measuring volume as it has no markings

A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.																						
3 mark answer	2 mark answer	1 mark answer																												
Demonstrates a good understanding of the chemistry involved. A good comprehension of the chemistry has provided in a logically correct, including a statement of the principles involved and the application of these to respond to the problem.	Demonstrates a reasonable understanding of the chemistry involved, making some statement(s) which are relevant to the situation, showing that the problem is understood.	Demonstrates a limited understanding of the chemistry involved. The candidate has made some statement(s) which are relevant to the situation, showing that at least a little of the chemistry within the problem is understood.
